I switched out the 20m LC network and switched in the 40m elevated radial via a DPDT slide switch and mounted all in the a small lightweight dental floss case (pics below). I'm still playing with lengths of wire to balance out the best SWR on both bands. Plus I discovered the position of the radial relative to the inverted L element changes the SWR a bit. Fun stuff ...did I say it worked!! Woohoo!

I made several QSOs with my MTR while it was setup in the backyard on a 18' fishing pole pulled over into an inverted L configuration and the feed point about 5' above ground. I kept the elevated radial about 3-4' above ground and tied off to a bush about 40' away. Now looking forward to testing it out on a summit soon for SOTA!

Hi and Good Day,

I am wrapping up the build on SN 241. I greatly appreciate the other threads offering suggestions. I too couldn't seem to keep the band switch stable for 40M. It tended to go to 80M more often than not. I replaced R4 with a 39K and all is well there.

Also wound the extra turn (12 total) on L10, and the power out is the same for 40M and 20M.

I am struggling with the RX sensitivity. Seems kind of deaf at the moment. A question for those of you that might have some insight. If I inject a signal at the antenna input, should I pretty much see the same strength at the input of U3? I'm seeing about a 3db drop across the TX filter, and then a significant drop across the RX filter. I really don't see anything after L8, although I can hear it in the headphones, so I know some is getting into the mixer. I'm really not hearing the signals I think I should though. As best I can tell, I am coming through the correct inductors for each band. RX sensitivity seems a bit better for 20M, but not by much. Any thoughts or suggestions welcome.

Seems like a lovely little rig and I can't wait to get it on the air.

Kind Regards,

Robert NQ0T

You know, Steve, I have the exact same "problems" with Field Day. FD in Chama began with two people, Steve, WD9FJL, and I. We did it by ourselves for quite a few years, we won the two-man team B catagory six times.

One friend kept asking to join, we let him, and that moved us into the wide-open any number of people (yet still one transmitter) catagory. After a second place, we won that catagory twice.

With the number opened up, we had others. Two years ago we went to three QRP transmitters, and last year that caused the addition of a GOTA station and a VHF station, and more people. Last year we had ten people including Guy, Ron, and Oleh.

While everyone contributes something, I remain at the crux, meaning whereas one person brings a radio, another brings an antenna, I bring my entire station, four antennas covering all bands, batteries, multiple masts, the bow for getting lines over tall trees ... I tie the arrows onto the lines because no one else knows knots (!?!), I shoot the arrow, I run to the other side of the tree because the others aren't fit, I untie, because no one else knows knots, tie on the new heavier line (same reason, run back to wind it up, while people watch me go (because they aren't fit enough to run back and forth once, let alone all day), to pull it back across and attach the antenna (because no one else knows knots), then THEY are tired, and need to sit down before keeling over, and they begin asking, "what's for dinner," as I glance over at my stove ...

Steve ...

Your 40/20 antenna system seems to be almost exactly what I plan to do when my MTR is finished and on the air. For minimal weight and effectiveness, I like it.

You might share the details of your matcher with the group, if you would. Is it the tuned network approach, or the transformer approach? Connection details, number of turns, wire size, core details, capacitor, etc?

Thanks ... Reed K7FLY

From: nj2e
Topic: 11180 Message: 11180

Hello Everyone, I completed a ATS-4B for a friend and need some help. The radio worked on power up. Except that when I press S 4, the display shows "Off" and the frequency and other information is still displayed. The radio powers up as soon as the battery is connected and the display back lighting is on all the time. All other switch functions are normal, the receiver hears and the transmitter output is normal. I replaced Q3, without change. In advance thank you for any suggestions. 73, Don NJ2E

Thanks for good information.

I already have "Atlas DCA - Semiconductor Analyzer - Model DCA55".
http://www.peakelec.co.uk/acatalog/jz_dca55.html
http://www.youtube.com/watch?v=zo_BejqYSF8&feature=youtu.be

I will check my BS170's Gate Threshold Voltage when I will receive my BS170 from online shop. Then I will replace all BS170 with matched one.

OK, yes, a tuned circuit. I have used that concept many times on 40M, except with an air coil, rather than a ferrite toroid. It works very well, except I think the tuning is more critical than the transformer approach (which I suspect is less efficient).

Thanks for the details.

If I am reading this "problem" correctly, this is normal operation.

When you first connect power the radio will power up. After

powering down the radio, does it stay powered down until you

do a normal power up from the switch? It should power up/down

normally until the battery is disconnected. Upon reconnection

of the battery it will power up by itself the first time, each time.

At least, this is the way mine works.

Understand that it will power up as soon as the battery is connected, but when I press and hold the "Function" button, "off" appears on the
display. The frequency and other data remains on the display. Also I still hear noise in the headset. Holding S5 (On) doesn't clear the "Off", only disconnecting and reconnecting the battery will do that.

HI Don, Maybe I misunderstood. It starts up, when you connect the battery. Then if you tune around the band... then hold the function button, "off" appears but it does not shut off. The only way to shut off... is to disconnect the battery. Is that correct?

Have a great day,

Nope... sure isn't. I've had that happen before, a couple times, one was a Q8 failure, the other was simply rosin under the microprocessor, causing a lot of issues and the power issue was the most noticeable and easy to fix. Cleaning wasn't tho.Good Luck,

Dale..... and anyone else interested.

Up until about 3 years ago, I was working as an electronics specialist in a power plant. I maintained ALL the pollution monitoring electronics, as well as many of the other plant systems. Soldering was something I did a lot of. In fact, had I still been at the plant, I probably would have attempted my ATS-4B using the plant SMD tools at lunch every day. I was just not equipped for that at home. Can't go back, plant is union, I am not union anymore. <grin>.

ANYWAY....

We used a product called Enviro-Tech Defluxer - 1676. This stuff would really wash the flux away. A few applications with a blast of canned compressed air in between, and it was clean. I was so impressed with it that I bought a case of 12 cans for the house too.

I gave up a lot when I promoted up to the control center. No more professional soldering station, no more bead blaster, no more lathe, drill press, band-saw..... welder and plasma cutter..... But no more overtime either! And that was a blessing.

Hope this helps someone.

Enviro-Tech Defluxer - 1676. http://www.galco.com/buy/Techspray/1676-22S

Oops - it says obsolete. Well - they had to replace it with something! Click on SEE ALTERNATIVES. Suddenly that case wasn't a bad idea after all. Wow - it got expensive too..... but you only need 1 can.

11193. BFO Adjustment Help.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-08 19:23:42 UTC
From: Martin
Topic: 11193 Message: 11193

Hi everyone,

MTR #263 is almost complete but I am a bit unsure about the BFO adjustment procedure.
I inserted my headphones into the socket, followed the instructions and
heard the loud tone.
When I adjust CT1 the tone is varying in frequency but I am not sure what is meant by
"peaking" it.
Am I listening for the highest audible frequency or no tone at all?
Should I use an audio spectrum analyser program and if so, which one?
Do I need to solder a short wire to TP2 and one of the headphone jack pins if I have the
headphone jack already soldered to the board?
Apologies for the barrage of questions but as you can see, my ignorance is quite
comprehensive!

Thanks in advance
Martin

11195. Montana land ownership map

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-09 01:11:00 UTC
From: Skyridr
Topic: 11195 Message: 11195

Identification of public land is now easier due to an online site, <http://svc.mt.gov/msl/mtcadastral/>. Also, owners of private property are listed. Access the site, zoom in, and click to obtain data. Perhaps similar sites are available for other states? This certainly makes SOTA site selection easier.

In Montana, some sections of public and private land are assigned in a checkerboard fashion. By law, it is trespassing to step from the corner of one section of public land to another, even though you don't touch any private land. Perhaps this law may be modified in the future.

Snow is melting, but mountain trails are still muddy and slick. Even reaching some trailheads is difficult at this time.

11198. Yet Another Battery Solution, this One Utilizing Supercapacitors

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-09 21:04:02 UTC
From: reed2web
Topic: 11198 Message: 11198

First, I would like to thank Colin Evans M0CGH for doing an excellent job building the board for MTR #247. My eyesight at this point in codger decline is barely adequate for conventional ckt boards, much less SMT boards, and Colin's help was so much appreciated.

I have read many good battery ideas from the AT_Sprint group. For starters, I decided to see what I could do with a conventional 9V battery because they are available almost anywhere in a pinch. Problem is, they are not designed for current anywhere near the 500-600 ma needed. (They have high internal resistance, and low capacity.)

So far, I have only found one conventional form-factor 9v battery where the manufacturer advertises 1000 ma max load current. The others are not even close. This is the Energizer LA522 Advanced Lithium 9v battery. Specs indicate it will put out 500 ma at 7.5v (relatively flat) for 0.8 hr. Cost: $5 - $6.

However, the general-purpose Alkaline batteries are all that are available at typical stores. These have limited ma-hours, and very limited max discharge current. One solution is to put "supercapacitors" in the MTR so that power can be buffered between the dots and dashes and characters.

I purchased five one-farad (1,000,000 mf) 2.7v capacitors and connected them in series, rendering 200,000 mf. These, I placed at the power input to the MTR. They are small enough that they will fit inside, along with a 9v battery. (However, I decided I did not want a battery inside the case.)

With a half-used alkaline 9v battery, I see close to a 100% increase in power for dits and about 50% increase in power output for dahs. This is a rough measurement because the watt-meter needle dances around.

If I had to do it over, I would use 10 supercapacitors instead of 5. BTW, the Mouser number is 504HV0810-2R7105-R, and the cost is $1.66 ea. The important criteria are low ESR (internal resistance) like .02 ohm, high capacity, and small size.

I also added a battery voltage indicator to the rig. It is a 6.2 volt zener diode, 680 ohm resistor, and red LED, all in series. The LED fades black as the battery voltage drops below about 7.5v. At 8.5 volts it uses 1.5 ma. The LED I chose was small and efficient with low rated turn-on voltage. LEDs vary in efficiency and activation voltage.

I found this LED circuit to be a very good indicator of instantaneous supply voltage. You can see it seriously blink down when transmitting. It showed a noticeable improvement with the supercapacitors.

My concern is that when power is applied, the slow rise to power (as the supercapacitors charge up) might have some impact on microprocessor initialization. To minimize problems, I think it would be good to wait 30 seconds or more after removing power before applying power. This would assure that the microprocessor had fully shut down before it was started up again.

A big thank you to everyone who replied to my queries.

I am pleased to say that I am up and running with a nice steady 3 watts out for 9 volts supply on 40 and 20 meters.

I noticed that on 40 meters there is no discernable temperature rise in the three final transistors but on 20 meters they get quite hot after a short QSO. Is this normal?
I would like some reassurance before I install the board in its case.

Thank you in advance
Martin

Hi Martin, A good clue to If that is right or not.. along with the temp rise.. is the currant being drawn at what voltage. They can run quite warm.. but the warmer they get... the less tolerant of key down length and any increase of swr,above a 1:1 match.

Have a great day,

Hi Dale,

I guess I will have to keep QSOs short and to the point on 20 meters!

I just found it strange that they hardly heat up at all on 40 meters.

Thanks for the reply.

As Dale said, you need to measure the current drawn by the rig. It is not always the case that tweaking the coils for highest power out is the best setting.

My finals do not get warm on either band IF the load is matched. That includes running the radio at 5 watts out.

From: Yannick
Topic: 11193 Message: 11204

Hi Martin,

My MTR is from the first run and I don't know what are the directions for the alignment in the second run manual.
However I first did the filter peaking by ears. Not "peaking it" but centering the tone like the manual told to do.
That mean you start by lowering the frequency to the point you hear the signal start to decrease. This is the lower skirt of the filter. Then you go the other way (increasing the F) counting the steps until the tone starts to decrease to the same amount it has decreased at the lower skirt. Finally you go back to the "center point" that mean decreasing the F to half the steps you counted. You save.

I did it a second time using the spectroscope software. It was more to "play with it" rather than by need. Final setting were close to the initial one.

Now I even have a oscilloscope on my bench but really don't feel the need to align it. The MTR work great. Filter bandwidth is optimal for the intended usage.

I recently had my first stateside QSO with K7XB using the MTR. Antenna setup was suboptimal : GP with 4 radials close to the sea but on a hill side facing SW instead of N.
The 4W of the MTR were helped by a 55W amplifier. All running on a SLA battery.

20m condx were mediocre so I had only a few QSO in around 4 hours of operating. It was nonetheless a great fun to be able to do EU and NA QSOs with a station contained in a back-pack that I can setup in less than 5 minutes.

73,
Yan.

FYI, fixed the power output problem, I removed 1 turn on the smaller coil and am now getting 4.2w out with 10.5v :)

11211. Power Outputs #247, For Comparison

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-12 01:05:16 UTC
From: reed2web
Topic: 11211 Message: 11211

For comparison, here follows power outputs for MTR #247. The RMS power numbers were calculated from measurements from a 100 MHz scope while feeding a 50-ohm resistive load.

Watts Current
Volts 40M 20M 40M 20M
8.0 2.00 1.63 530 510 ma
8.5 2.43 1.85 570 540
10.0 3.42 2.43 640 620

These numbers were recorded after L10 was rewound and squished tight, which produced about a 50% increase on 20M. Comments welcome.

Reed ... K7FLY

From: reed2web
Topic: 11211 Message: 11213

Yahoo pretty much trashed the table formatting in my original msg, so here's another try:

8.00v: 40M-watts=2.00, 20M-watts=1.63, 40M-ma=530, 20M-ma=510
8.50v: 40M-watts=2.43, 20M-watts=1.85, 40M-ma=570, 20M-ma=540
10.0v: 40M-watts=3.42, 20M-watts=2.43, 40M-ma=640, 20M-ma=620

From: Yannick
Topic: 11203 Message: 11214

Hi Fred,

That's interesting.
During my last operation I have noticed the MTR final was cooler when running through the 55W amp than when running barefoot.
I was only a feeling and somewhat subtle so I thought it was due to the battery voltage drop being higher with the amp connected.
This may rather be because of the 55w loading the MTR final to a load being close to 50ohms.

73,
Yan.

11215. ATS-4 locked in straight key mode

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-13 15:14:37 UTC
From: pgschreier
Topic: 11215 Message: 11215

For some 2 years, my ATS-4 has been my "go to" rig, done almost 100 SOTA activations with it and love the hot receiver.

Note: this is an ATS-4, Rev A, second run kit

The other day, I powered up and found myself stuck in straight key mode.

Having reviewed this list, I tried to force a CPU reset by holding various buttons while powering up. This just made the problem worse -- not only am I stuck in straight key mode, I'm stuck in RIT mode, too, with the upper line of the display showing the RIT frequency.

Is there anything I can do short of replacing the CPU? (Ug, I shudder at the thought.)

tnx,
Paul AA1MI / HB9DST

Hi Dale,

Letting it sit for hours and longer seems to do nothing.

I did play around by changing bands and using the SP button and finally got it out of RIT mode so I can tune again.

However, I'm still stuck in straight key mode.

How does one go about giving an ATS-4 a brain transplant, if it comes to that?

Hi Paul,Can you use a DVM to measure ohms to ground... on each of the keying lines on your paddle? Then if you find a difference, and one side is low ohms... unplug from the radio.. see if it goes up?Bet it does. So the problem is in the radio... pop the lid off.. plug the paddle back in... measure the low side again.. still there? nope? or yes? No - problem is from jack to lid. be very cautious about letting the jack slip sideways.. the pin shorts to the lid.yes- the wires between the jack and the board are rather brittle.. and sometimes enough vibration will pop one loose to short. Still figure it is a brain issue? I swap the processor out with hot air.. but with a lot of care and focus on where the air is directed.. and for how long... the heat applied gets to the other side of the board quick... and messes up the buttons, so they suddenly need replacing too. IF you want to ship it here, I can do that or go a bit deeper before that drastic a measure.But the replacement IC is a bit of an issue... Steve is on the trail.. and I don't have any.. but from one that I have here that isn't built yet. Maybe I can borrow it, til he gets back. Which model 4 is it?

Have a great day,

I'm just thinking out loud here.... but IIRC, it goes to straight key mode when you power it up with two contacts shorted at the key jack.

Was it me - I would use an ohm meter and probe around the key connections - looking for something shorting it.

Could still be a shorted processor input, but the jack and wires is a simple thing to look at before brain surgery.

Hope this helps.

Looking through the Group message archive (which is always a good thing to do for cases like this) it appears to have happened to other people, it's something to do with saving the state when in straight key mode.

The way to get out of it appears to be to power up the rig with the menu button held down.

If that doesn't fix it then I'd suspect a hardware fault with the key input lines, hopefully it's not actually a microprocessor input that is damaged.

Hi all,

Thanks for all the advice.

It turned out to be a mechanical/wiring error. Probably too much bouncing around in my backpack or something. Who knows?

Anyway, things are back to normal (for the moment) and I can start using my ATS4 with it's hot rx once again.

You may want to reflow the solder for the resistors that select the bands... particularly the one for 15...
they are on the front near the edge of the board, on the underneath of the buttons.

Have a great day,

Hi all,

Anyone knows if there is a postal tracking number for the MTR package ?

For the moment, I don't have received my MTR, I think the packet is in French Guiana for 3 weeks at least ! Always the same problem here...

But a tracking number could help me to know where is the packet.

For Steve, is he returned from his hike?

Thanks,
Loïc, FY8PE.

I haven't chimed in on this one yet. I haven't byuilt a '4B, but I built one of the first of the first run '4s. I believe a firmware problem is unlikely to cause your symptoms. I just downloaded the corrected CPU schematic for reference..

First off- The rig should NOT turn on as soon as you supply power. Q8 (the primary power pass transistor) is held OFF by R24. It stays off until it's gate is pulled low by the power on pushbutton. If the rig comes on immediately upon connecting the battery, one of 3 things is going on. Either Q8 is shorted (already replaced apparently) or the power switch is shorted, causing an always on condition, or- Q3 is providing the path to ground to keep Q8 on.

Ordinarily, when you turn the rig on by pushing the power button, Q8 conducts, supplying power to the MCU. When it wakes up, it turns on Q3, which keeps Q8 conducting. When you hold the function button down until OFF appears on the display, the MCU should turn off Q3 once you release the button, turning Q8 off. That's when the rig should "shut down". If it's not behaving like this, you need to find out if the switch is shorted, Q3 is shorted, or something else is keeping the gate of Q3 high. If you remove Q3, the rig should not turn on until you hold in the power button. It should then shut off as soon as you release it.

Good luck,
Bruce

From: Mike Olbrisch
Topic: 11180 Message: 11228

Gosh - my ATS-4 has a problem then.

After being off for a few hours, it ALWAYS powers up when the battery is connected the first time. After that, it is ON/OFF as expected until the end of the day when you disconnect the battery and put it away. The next time, it turns on again with the first application of power.

I was told this was normal. I guess I wasn't told the truth. Hope it won't damage anything, it is already packed and ready for our trip to Germany. If it will just hold on until I come back, then it can smoke!

Mike - KD9KC.

I'll have to dig mine out and check it again, Mike. I don't recall if mine shows this behaviour. I must be mis-remembering it's initial power applied behaviour. However, all of the other symptoms described, including not powering off, indicate that something is holding Q8 "on". The troubleshooting path I suggested is still valid.

Of course, you are right, Mike. Capacitor C71 has to charge initially when power is applied. This has the same effect has pressing the power on button. Thanks for pointing this out.

WHEW - then this IS normal.... and I am not carrying a ticking time-bomb failure waiting to happen while on vacation. That is a relief.

My brother-in-law Helmut (DG7NFV) has a field-day party planned for my visit, the B-10 club meeting will be held on a summit near Bad Kissingen in June. Kind of a party for our visit. I expect my ATS-4B and 40-30-20-17-15m EFHWA system weighing less than 2 pounds will be a hit with the guys.

Mike - KD9KC.

Please disregard the paragraph below about intitial power application. The rig should come on when power is first applied. Approach your troubleshooting of this power issue from the second paragraph. Figure out why it is not shutting off, by checking the operation of the transistor (Q3) that controls Q8. Once the rig is on, you should see a logic "high" signal on the gate of Q3 (about 2.3-3.2v). When you hold the function button until "OFF" appears on the display, the gate should go low (close to zero volts), after you release the button, to turn off Q3.

Yep, that's the one, Johnny... and because the mixing is different on 80... it won't play there..
IF you set the DD for 40 - 15... OR.. it plays right nice on 80, but not on the rest of the bands.
I even thought about having two DD connected... one just for 80. It gets a bit unwieldy that way tho.
Good Luck!!

Have a great day,

The firmware in the MCU used in the QBSA allowed it to work on all the bands on my ATS3, including 80M. Perhaps Steve would consider making a version of the Digital Dial with similar firmware, to recognize the RX DDS Frequencies, and provide the approprite operating freq display. Or offer an MCU exchange program, for unbuilt kits.

As we non-programmers like to say, it's just a simple matter of programming, right?

Gm Guys:
Well Bruce that would be a thought.
I tried Dales suggestions, and it works, but it's not worth the pain is not worth the gain!!
I am gonna mount the little rig in a small "Pelcan" box I found and forget the display!
Thanks
72

From: n1rx
Topic: 11233 Message: 11239

Since the user of an ATS-series rig is by definition, a "know code" amateur radio operator, having the Morse readout of frequency is usually adequate... 8-)

Have fun!

For those interested.

Burt (K1OIK) has been making videos at our regional semi-annual HAM flea (HossTraders, now NearFest) for many years. He shares them on YouTube after each 'fest. Earlier this month, he stopped by my table and asked me to say a few words about a couple items I had. Here's the video he posted this morning:

Will,

They were a limited run of 150 units or so and they sold out within hours. Only option now is finding someone willing to part with their kit.

Or, contact the designer, get the file for the PCB layout, and get permission to do your own run of 150 (or 300 or more). You and I can't be the only people who wish we hadn't missed the boat. I'd happily pay more than the original price.

If someone is motivated to do this, Kickstarter would be a way to measure interest. I'd certainly pledge.

Hmmm Kevin you may be on to something...although the original owner would probably want/deserve some royalties for coming up with the original design.

Hi Steve,
With the radio off, using a dvm, is there a short to ground on pin 3 of U10? But before that, are the regulated voltages good? U10 must see 3.3 on pin 2 to start. Maybe a really good look for soldering that isn't quite there, or a short somewhere?

Have a great day,

No short on pin 3 or on path to R28. 3.3 v appears where it should. I had a difficult time finding pin 1 of U9. It is installed with the part ID inverted.

Hello Steve,

What is the voltage at pin 19 of U10 (easier to measure at the junction of R29 and R39)? It should be a little more than 1/10 of your supply voltage, e.g., about 1.1V if your supply voltage is 9V or 1.4V if your supply voltage is 12V. I found that no voltage at pin 19 meant no sidetone either.

Also, is the MTR actually transmitting when you key it so that there is are pulses out of pin 24 of U10 (easier to detect at R26)?

From: Steven Bornstein
Topic: 11257 Message: 11257

If I inject an audio signal at R28 I have output. There is continuity from U10 pin 3 to R28. For some reason I don't have side tone at pin 3. I do have "faint" clicks when the display functions or when I use the paddle.

I have not tested the transmit as I was following the alignment and test procedure.

Hi Kevin,
I am new to this group also. I was so interested in the radio from all of the reviews that I read about it, I got really brave and I actually did contact Steve and asked him if he would be willing to send me the board artwork etc, so I could build one myself. Not surprisingly he was not willing to part with the design. (I wouldn't have either, but I had to ask.) I totally understand and support his decision not to. He must have a tremendous amount of time and work in it.

Maybe if there is enough interest here he would consider making another run. I would be willing to prepay for the unit if that would help.

From: rasteenb
Topic: 11259 Message: 11259

Does anybody have a Ten-Tec ATS-4b enclosure they'd sell?

Thanks,
Rob

Bob, Kevin;

Getting Steve to round up another 150 or more kits, along with the contracted-out case for the MTR, is a little like asking someone to forget their private lives and go to a psych ward for six months to a year! However, if he got barnstormed with a 200-kit per op "order", and the money to fiance everything, he might just come out of hiding and do it again. I failed to send in my check "in confidence" long before he got the last series out, as did several others, so I'm looking at all kinds of metal boxes of the approximate size to enclose my one MTR kit. Don't feel bad, I thought I had my year all set up for "one item at a time" to get too many items done, then Murphy came along, my sister told me to think about having my rather small "hobby cabin" centrally air conditioned and heated, due to window units that are MIC (Made In China), predestined to send to the recycle system after bad manufacture and LOUSY construction, and a central system would cost only a little more. My gear and every expensive ham radio and hi-fi system item would do well with a dehumidified structure for the first time ever, I wouldn't fry my brains while I try to make sense out of SMT parts as I get "too many" kits in line to assemble.
One brave soul needs to be bold with Steve, get his attention, then urge him along with a solid money order or whatever, and wait a year. I'm just now coming out of my nose dive into a tuberculosis "booster shot" that I was due for at my age, a lifetime after the last one was given out post W.W. II, so I'm going to be making haste on everything I look at during the night time. Down here in South Texas, on Mustang Island, I have to be prepared to act appropriately to a hurricane warning, drive some 90 miles to my house of safety - and set up my rigs!

Good luck to the first one to make the motion for Steve to get interested again, since he might be on yet another project.

Way too much drama over this topic.

1. Steve is not "in hiding". He's living his life as he wishes.
2. Steve has already said he will be ordering and selling cases for those with a "naked" MTR.
3. When Steve is ready to sell more radio kits, he will. Since the MTR is so popular, I expect there will be another run.
4. Stay tuned.

My opinions only.

Isn't Steve hiking the Appalachian Trail this summer as usual? Wasn't that well discussed? Hiding? If so, might be for a better signal to noise ratio. <Grin>.

Indeed. Also, Steve has said he does not accept orders until he has announced availability here. I assume he shreds checks that arrive early. There are some nice kits up at qrpkits.com, including several KD1JV designs.

Ge all:
Hope you Memorial Day weekend has been good. I finished up my AT 3b.4 this weekend that I got from N0YJ. He was having problems finding the time to build it.
He told me about some small pelican cases, and here is the results of our brainstorming!
It kinda looks like Dale's PFR3 that is weather proof. It was real fun but it was also a pain to make it all fit like I wanted it to.

It's really a pity that a such, winner, requested, well developed project is not shared as schematic, pcb layout and firmware to the ham community. For example with a GPL licence similar to those used by opensource software.

It is only the pcb layout that isn't shared, all the rest including
the firmware is in the files section.

My advice is to wait until Steve announces yet another run of the MTR, which I am sure that he will do, either in the fall or the spring. Keep in mind that this is not a major production facility, it is one guy doing everything and he likes to have a life too.

If you can't wait then maybe trying finding someone willing to part with their MTR or ATS3B (very similar radio) or look at the Hendricks QRP Weber Tri-Bander or maybe even the PFR3.

Really Paolo?

If you think it is such a pity, there is an easy way around that problem.

You can design your own radio. In fact, if you do this you will not be stuck with the design parameters that Steve imposes on his radios. You can make it as many bands, or as heavy as you like.

When you are done with the design work, you can build one, and work out all the bugs.

Once you have the proto-type working perfectly, you can design a case to fit it in. Again, since you are in control, you can make it as big or small as you like.... internal or external battery, internal or external tuner too.

When you get all that done, then you can write the manual to turn it in to a kit.

Once the manual is finished, you will need to get a few friends to build it as a "BETA" test, to be sure you didn't miss anything.

After all this, the last step is to order hundreds of parts, and divide the parts into "KITS" that you can sell to people so they too can have a radio just like yours.

NOW.... when you have done all this... and sold all the kits.... REMEMBER THIS. When someone wants to get a copy of all your work so they can make their own circuit board. Just remember your statement about what a pity it is that they can't have it, then give them a copy or your work as an OPEN SOURCE, something similar to a GPL LICENSE. And be sure to do it with a smile, knowing you are the better man.

I look forward to getting an open source copy of your work. But until them, I am very happy to have one of Steve's ATS-4B radios, whichever way he chooses to share all his hard work.

Thank you Steve.

Mike - KD9KC.

It's really a pity that a such, winner, requested, well developed project is not shared as schematic, pcb layout and firmware to the ham community. For example with a GPL licence similar to those used by opensource software.

Hey, folks:

We're not going to have a flame war on this topic are we? Because that would suck.

Steve designs some nifty radios, and is entitled to sell them on whatever terms he likes. Demand currently outstrips supply for some models. Perhaps that will change at some point, perhaps it won't, but there's one thing we can be absolutely certain of: griping about the situation on this list won't change a damn thing.

Alan;

Actually, I don't see this shaping up as a flame war, it's more like "advice to the originator of an invention or copyright", and I've seen the results of such a need, to prevent invasion of legal rights and original work.
The most blatant example I keep in mind are the pictures of my own "home city" that my Dad made from a small airplane, around 1937. He was a pioneer on ariel photography here, learning to imitate the best professional photographers of his era, then went so far as to have picture postcards made of them. His one mistake was in assuming that most people are as honest as can be, while the truth is that even, and especially the rich, have larceny in their veins, a thief's outlook on life, and all the consideration of an alligator about the rights of others and their inventions/productions.
Within a month of Dad's postcards being set up for sale, a whole FOUR cents each, the local city mayor took one, noted "no copyright statement", then had them reproduced by the hundreds! That man got THREE cents each for the postcards, so naturally my Dad lost out. All he did was to remove them from the few stores that existed here at the time, put them into a storage bin, and locked them up.

Years passed, I found the leftover copies, and asked what they were about, so my Mom told me the full story. Dad was so furious about that theft that he never did any publications again, "It got in the way of his fishing", thus the pictures remain in the storage vault. Once every several years, someone will mention "having bought a picture by Frank Gibbs of Port Aransas, it was on eBay, and it's valuable, it went for $20!". I just grin at them, tell them "It's a fake, the old man who bought and plagiarized them just caused harm to the whole idea, since my Dad never signed his work, or put a copyright mark on it". Some remarks are terse and ugly, "The picture was still made by Gibbs, so it's genuine", then I sink them by quoting the law, "If the originator has been violated, with the thief having noted the lack of legal identification, then the work is NOT legal and the thief can be held accountable for the theft".
That statement of mine, having been put in the public domain (the Internet), thus made the illegally copied pictures worthless, and some "investment buyers" were disgusted, they had made extra precautions to keep such valuable postcards in safe places!
Over the years, Dad did make the remark that "the mayor was dumb, all he had to do was bring a lawyer to a visit here, have a legal contract written up, then with costs and profits divided up properly, both of us could have made money, and the pictures would legally be very valuable".
The old man made many enemies by stealing from my Dad, with local people

avoiding him like the plague!

Many decades ago, I did find out that a bar on the waterfront here had been "graced with the fine sand dune picture of Frank Gibbs", so as I left, I made a nice hit on the wildlife in the picture with part of a cheeseburger. Dad thought I had done a nice touch, since he never went into "public places where the liars and thieves, gamblers and others" wasted their time, he stayed home and carved out art forms from wood pieces that floated in from Mexico.
The whole sham was "blown to the wind" by Hurricane Celia, when it hit in 1970, and I grinned at the idea of another thief losing an item that he stole!

I have pictures that I managed to capture, of the actual eye of Hurricane Celia, "at the risk of my life", and I have given them away to teachers, researchers, many other officials who do figure out what they're about. My story of that storm and surviving it is in "the public domain", for pubic education, thus I never lose any money on my work. I do plan to rewrite the story, then have the pictures enlarged and clarified, before my last day on this earth, so that my sister and other relatives can copyright them, perhaps make some cash out of my work. Not many people can make honest statements of "Here is what the center of the eye of a hurricane looks like", so my experience is an attention getter.
What did I learn from that experience besides the fact that hurricane winds can kill? A lot, but especially that radio antennas can be set up that can withstand the hard brutality of such hard winds, and how to build them. All it takes is a little ingenuity and a lot of hard work.

Thus, we can thank Steve for his incredible contribution to the art of our hobby, forming out a transceiver that can be used on the CW portions of the bands, all in a pocket sized rig, which is pure genius and fulfills the one nearly science-fiction idea of "a rig that can do anything, yet is so small that it fits in a shirt pocket, the largest part is the antenna!".

Beware, all of you, to make certain that, if you figure out an item or take a picture that is quite attractive, go straight to a lawyer and have your copyright rights written out! The effort and money you expend can be recovered from others who will buy the item, and you don't lose anything.... at least not legally!
Before I forget, too, do yourselves a favor and keep your cars locked up, mine has been invaded twice, once when it was mint new, it got damaged by a hothead kid who was jealous of me, now I think he's in prison on another charge. Not long ago, a burglar opened my driver's door, looted the center console, stole a small pistol - so I turned that in to the cops, the goon is back in prison, and I learned that no one can trust anyone with a small pistol, he tried to sell it on the street, two blocks away! Same idea for your mobile ham rig, the thieves can get all of $20 for "recycled metal radio parts", when the rig they stole is

worth THOUSANDS!

Thanks for the bandwidth, I tried to be worth the read.

It's a hobby for Steve, and he's passionate about making them right. He has handed other designs like this over to qrpkits, perhaps he could be lobbied to do the same with the MTR. But it would be extremely bad form to clone and sell his kits without permission.
Any ideas on parts that would be good for a new design? I'd consider the Si514 for the VFO. What digital modes could a TI Tiva support? There's plenty of new mixers and audio amps to choose from.

Whether you call it a shame or an opportunity is a matter of perspective. "It's a shame" is a phrase which means different things to different people. To some, it genuinely denotes something shameful/immoral. To others, it means something similar to, "It's too bad."

As in, "It's too bad there aren't more of these available. There's a bunch more people who would really like to get one." Or, "It's a shame nobody else sells something comparable. I'd buy one in a heartbeat." Or, "What an opportunity. There's a market here."

For some owners, the exclusivity of the product is part of its appeal. That's inherently in conflict with the desires of those who don't own one but would like to. Some of the don't-haves might be able to design something similar. For some of us, the things that would have to be sacrificed in order to acquire those skills are too high a price for a new radio, so we'll do without.

It's a cool design. If I'd learned about it before the day it became available, I might have bought one, but I needed more time to understand what made it unique than the time available before it sold out. In my case, it is probably good that I can't buy one. With time for a little reflection, I can remember that I don't actually need one of each cool radio. I can admire the design without owning it.

Mike,

I only add this before leaving this group.

My proposal to release the work of Steve as GPL was a simple idea to protect it!!.

The GPL licence permits to copy a work but deny the possibility to derive from the original work a businesses.

So if my work is under the GPL licence all the derived work must be under the same licence.

If the schematics and the firmware that I can download from these site are protected with a GPL like licence, all the derived work as , for example a PCB, are also and must be under the GPL licence.

See the example of arduino...

So.... 73 to all, and SK for me on this valuable group.

Excuse also for my pooor english...

Paolo,
I wouldn't leave the group. You have a valid point regarding putting the kit under GPL. Let's face it Linus Torvalds http://en.wikipedia.org/wiki/Linus_Torvalds, Mark Spencer of Asterisk and many many more people have given the world, not just a tiny little group such as this, open source Linux, Asterisk, Open APRS ect ect. The way they get compensated is through advertising, commercial sales etc. They can enlist smart guys like KD9KC to help with the project to improve it's design and to do the beta testing before the next stable release. It also ensures their legacy and makes the project they offer through open source bigger than the sum of its parts. Steve would do quite well to go open source. He would most likely make a lot more money, and have a free staff of engineers from around the world eager to assist with the product evolution.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-29 13:55:44 UTC
From: Mike Olbrisch
Topic: 11246 Message: 11282

You are right Kevin. If I could afford every radio I think would be cool to own I would be broke, and I would need a second house just to store them in.

Let's not even get into collecting cool guns! <grin>.

I got the ATS-4B with one summit in mind. This summit is a 10-pointer in my local area. There is just no way I would attempt it with my usual backpack. In fact, I may do it in two stages, the first stage being a scouting probe where I place some water under some rocks half-way up in prep for the main assault. Right now my ATS-4b kit with a 40-30-20-17-15m antenna is under 2 pounds complete. My standard system is about 8 pounds.

A hike like this will require at least 8 pounds (1 gallon) of water - there is no water at that elevation in the desert, not even a small seep like further south in the Franklins. The summit is too steep and rugged for an overnight stay, and the logistics of an extended stay would increase the pack weight considerably. It will need to be a high-speed and low-drag operation.

Steve puts a ton of effort into his radios. I have done work like that in other areas, and until you have done it you just can't understand all the work it takes to get everything right. I am certainly as frugal as the next ham, always looking for the best deal. But to say that it is a shame that Steve doesn't give his work away for free? That just isn't right. As it is, I don't believe he really turns much of a profit. But he did the work, and he has the right to sell or release his work as he likes.

I am sorry Paolo feels stepped on. But if he tried doing something like this himself, maybe he wouldn't feel it was so shameful that Steve doesn't release his work into the public domain. That was the point of my reply to him.

The MTR seems to be very popular. I am thinking steve will probably do another run. If he ever does another run of the ATS-4, I think I want two more. Then I can build one with each of the grand-kids and get them started. It will be a slow project, but that seems like a good way for grand-pa to spend time with the grand-kids AND get then started in radio.

Mike - KD9KC.

Folks...maybe we need to cut Paolo some slack...he admitted that English isn't his first language...there are a great many nuances that just can't be conveyed in a second language unless you are fluent in said language.

Many words just don't fit and a second language user certainly makes a few mistakes in usage.

I've lived over seas for several years and traveled to many places in my work and I can tell you first hand how difficult it is to get by in a second language and how even more difficult it is to write in a second language.

I'm just saying (grin).

Paolo, I hope you stay on this very informative list and don't let English get in your way.

Ciao amici Paolo.

and until you have done it you just can't understand all the work it takes to get everything right. I am certainly as frugal as the next ham, always looking for the best deal. But to say that it is a shame that Steve doesn't give his work away for free? That just isn't right. As it is, I don't believe he really turns much of a profit. But he did the work, and he has the right to sell or release his work as he likes.
>
>
>
> I am sorry Paolo feels stepped on. But if he tried doing something like this himself, maybe he wouldn't feel it was so shameful that Steve doesn't release his work into the public domain. That was the point of my reply to him.

Nothing wrong with what Paolo said, I hope he sticks around.
And he's right, it would be good to have a rig like this
more easily available. But it's Steve's design, and he'd
be rightly pissed if people cloned it to sell without
permission. Way too much drama.

11285. Heathkit Survey

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-29 20:11:04 UTC
From: Alan Dove
Topic: 11285 Message: 11285

Hey, folks:

Slightly off topic, but this is a kit-building list so I figured it would be okay. Apparently yet another group of optimists is trying to re-re-re-start Heathkit. They recently updated their web site with a hidden link to a survey about the company's future:

http://heathkit.com/survey/index.php/278489/lang-en

It's a pretty lengthy survey (took me about 15 minutes or so), and provides lots of opportunities for input. Of course there's no telling if it'll amount to anything, but hope springs eternal.

11286. Re: How to purchase an MTR?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-05-29 20:18:48 UTC
From: Andrew
Topic: 11246 Message: 11286

Hello, my first posting on here, being a bit new to amateur radio.

I was a little disappointed to miss out when the MTR sale was last on. I had asked about where to start, equipment wise, on the gqrp group at Yahoo just a few days before the sale and had been recommended the Steve Weber designs. I giggled to find his website. Nothing going on there. I asked again and was recommended to try the ATR_Sprint route. By the time I got there it was all over and deliveries were being discussed. As someone else said, even if I had started a couple of weeks earlier I would not have gained enough info about the mtr to have made a decision to buy in time. The qrpkits site also seemed to be dormant, although this may not be the case.

Anyway, I looked through the files section on here, to try to find out the spec of the mtr and was surprised to find the assembly manuals, including list of parts, circuit diagram, setting up instructions and operating instructions. Bargain!

As a learning aid (I am working up to the Full Licence exam on 1 July) I checked out the circuit diagram and worked through the way it operates. Took me a while to figure out several parts of the circuit but then I found, on the qrpkits website, some of Steve W's earlier designs. Some of these earlier designs share parts of the mtr circuit and I found a description of the workings of the circuit.

So, now I have a feel for how the mtr works I really want to design something similar for myself. I don't need to be pushing the weight and size to the minimum and I would prefer to have a display with more info, possibly a two line LCD (I have some left over from another project) and I want to have the ability to change features in the code. This means that I will be driving the rig with a PIC, which I am up to speed with, programmed in assembler.

I really want to thank Steve W for all of his effort in preparing and posting on here, the very complete constructors build manual.

Rans6 2e0uda.

Hello,

I recently came back from a one week primitive camping trip… Made contact every day with my MTR, 20m at noon and 40m after sundown. My set of eight AA rechargeable cells lasted the whole week! Great radio! It was comforting to have the MTR after my cell phone batteries ran out.. Nothing like hiking the AT, but it made me want more…

Have fun out there on the trail!

Gil.

Hi all

Just joined the group so though would say hello.

Looking for one of these devices to take my SOTA activities to the next level. Currently use a FT817 and whilst this is a great radio the idea of reducing the weight is desirable and the MTR and ATS keep topping the list of desirable devices.

It appears from here it is a case of waiting until the next run of devices are announced. Well that's cool, got time.

So patiently waiting,

Allen

Allen,
Also take a look at the PFR-3. I believe it is pretty much the same as the other two radios (designed by Steve Weber) except it has a built in antenna tuner. I have one and love it. Weighs 15 ounces, super receiver, built in keyer and memories for repeat calling, rit, direct freq entry from paddles, etc. I like the fact that the tuner is an integral part of it so I have my choice of antennas that this rig will conveniently tune for me. Bright yellow in color so you have a hard time losing it in the back country.

Allen,

I also have a PFR-3A and it is my favorite field radio. Heck, it is great in the shack running on the 8 AA cells and feeding my home antennas. Built it 2 years ago and it is going as strong as ever. I liked it so much that I sold my Yaesu FT-811. Sure would like to eventually get a MTR though! It would be great with my Buddipole as I have that antenna tuned perfectly on 20, 30 and 40. No need for an antenna tuner.

Yo Steve,

welcome back.

er.... just looking at the mtr_2 circuit diagram you posted on here, there seems to be an awful lot of positive feedback around U3b. Is there a typo or am I mistaken?

Also, "BSRES" doesn't come from anywhere and "TO_U8_PIN9" doesn't go to anywhere near U8!

"MUTE_PIN20_U8" doesn't go there either, U8 is only a 14 pin part!

Apart from that I think I have it sussed.

Best 73's,

Rans6....

HI

Yes the PFR-3A is on the list. Actually it was this device that lead me here. I've got time and really like the compactness of a MTR / ATS and happy to carry a resonate antenna. Planning a major trip early next year where the weight reduction will be crucial so will see how it goes. Still bumbling my way through CW so waiting and perfecting skills will not be a issue.

Steve's not quite back yet...

I think he edits the design within his board routing tool,
then adjusts the schematics to match without any real check.
So there's a number of minor errors in the schematics.

To address your questions:
The LM4808 is at U2 in the board drawings, not U3
The node with R8 ties to pin 6 of U2 (so neg feedback)
"TO_U8_PIN9" ties to "BRES"
"MUTE_PIN20_U8" ties to "MUTE"

There's a few more for you to find. In particular,
message 11071 identifies a mixup on reference designators
in the RX filters.

```
To correct your schematics for the errors Andrew has pointed out:
The LM4808 should be at U2a and U2b, not U3a and U3b
Swap pins +5 and -6 of U2b such that +5 is on the bottom
Where it says "TO_U8_PIN", should say "BRES"
Where it says "MUTE_PIN20_U8", should say "MUTE"

I don't think the U2b pin swap had been noticed before,
and could hang up somebody trying to debug their audio chain.

From: NAQCC
Topic: 2905 Message: 11297

NAQCC Sprint Tuesday night!

Our June sprint is coming up next Tuesday evening June 11th local USA time, which as everyone should know converts to Wednesday 0030 to 0230Z. After last month, we're back on schedule with our alternating 2nd Tuesday / 3rd Wednesday schedule in even / odd numbered months. As you know last month we changed weeks because of the Dayton Hamvention. We need to get back on track this month and shoot past the 100 logs mark again.

A lot of hams like to operate portable, and June would be a great month to put in a portable operation in our sprint with the warm weather and very late sunsets here in the eastern USA. It's also a vacation month, and you might like to take an hour or two off from the hectic vacation pace and relax in our sprint. They are relaxing with their laid-back non-frantic activity which we emphasize and encourage. Our goal is for you to participate and not particularly vie for those big scores. Of course if you do prefer scores with your participating, that's perfectly OK, and we have certificates for you if that is what you are after. I think that gives you enough reasons to be there next Tuesday evening.

Our June sprint is this coming Tuesday evening local time (June 11, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Wednesday June 12, 0030Z to 0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201306.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - check out the prize page on our website.

Oh, and we're adding something this month for those who do emphasize scoring. A certificate to the overall high-scorer who uses a bug, and one to the high scorer using anything other than a straight key or bug. We are doing that to help those who may be physically unable to use a straight key (or bug) for whatever reason. We will be incorporating that info into our rules soon.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6710+ members in: All 50 States - 9 VE Provinces - 94 Countries. Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

Hi Gang,

I'm finally back home from my 500 mile hiking trip, a bit slimmer then I was when I left, hi. Had a good walk dispite it being the coldest and 3d wetest spring on record down south.

So, if anyone is still missing parts or needs repair/troubleshooting contact me direct and will fix you up.

For those of you waiting to buy a case for your first run MTR, I'll get going on that soon. I need to order some shipping boxes and figure out how much to charge for postage first.

I'm currently with out transportation, which is a bit of an inconveniance living 10 miles from town. My old Volvo started leaking oil out the crankshaft seal just before I left for the trail and risk blowing it out completely if I drive it. It won't be until the 23d that it can be fixed. In the mean time, I'm working on finding alturnative ways of getting around.

Welcome back, amid all the rush to order stuff, maybe I could squeeze in,
and purchase a pair of processors for the MTR please?
Seems they don't like voltage to the key lines. And I didn't do it this time.

When it gets time to order the boxes and MTR.. I'm waiting patiently, no problem.

Sorry about the seal.. they are a fuss to change too. Not bad if you have all the tools,
tho.

Good luck, and thank you,

Have a great day,

If blowing the MSP430 IO buffers for the key is a recurring problem,
consider mounting 1K axial resistors through those holes in the board, then wiring the connector to the top of the resistors.

All,
Maybe it's just me, but I wouldn't sell it for any more than I paid for it.
If anyone should be making a profit, it should be Steve!
I'm sure one could look back on the list archives and find the one guy that just missed the window to purchase one.
I do remember someone wanting to buy one but had to take his wife to work!
These are my thoughts only.
I'm looking forward to building mine soon. Can you say furlough?

Hello Dave,

I agree with you. Several times have sold unbuilt kits because of no time to build, all went for less than my cost even if they were in demand and no longer available. This is a hobby for me, not a business.

To each his own, but seems rather small to profit in this particular situation, as many folks who wanted to buy one just missed the window. Unfortunately, some percentage of the buyers of Steve's products are likey speculators.

Scarcity always breeds this behavior in some fraction of humanity.

Actually the seller is selling it to the highest bidder, it's not the seller who determines the price, but the bidder. As in any auction, the selling price could have been below what the seller paid for it.
----- Original Message -----

Come on guys, have you not worked out who owns the kit in question? :-)

Ladies and Gentlemen:

If Ihave a rig, for which I paid $100 for the kit, and $100 donation to a fellow who didn't want $$'s, but I figured that was what he might get as a professional builder for his time,effort,and expertise, why shouldn't I ask $200 or more for a rig?

If I decide that I'm capable of building the kit, and actually get it running and up to specs(which is highly improbable for my ailing eyesight and somewhat shaky extremities) why shouldn't my time be worth what a professional might charge for buildingthe unit?

If someone else wants to put a rig on e-Bay, and see what the "market would bear" - who are we tocondemn such action?

The "holier than thou" comments concerning this sale are "very interesting"to me.

Note - I've seen a HW-9 sell for >$700 on that site, I might get my HW-9, with allthe WARC bands, back into operating condition and see what the traffic might bear? Thetransmitter works, the receiver has very low audio,which I figure is some leaky electrolytic capacitorin the audio system. Any offers? :)

This thread HAS to move into a political discussion simply because people who denigrate someone for making money off of someone else espouse, most often, the notion that everything has to be leveled to where it's "fair for all." That "notion" someone making HUGE amounts of money - smacks of socialism and, I'll pre-suppose, suggests those "denigrators" vote(d) "blue," live in California, believe taxation is a good thing and, in general, decry any sort of "movement" within our country to curtail or reduce taxation, hold off the rich from getting richer; in short, they can be found nodding their head whenever Boxer or Pelosi or obooma make any statement(s). Most often, they can be found lighting the votive candles they've placed under the picture of Lenin, Stalin or Jesse Jackson.

That's fine!!! However, it does open the door for a rash of "observations," such as N8XX posits below, regarding a "holier than thou" attitude --- that IS what socialism is all about.

I hope the moderator nips this in the bud but NOT before some of us "capitalists thinking sorts," who LOVE the notion of people making money, take the opportunity to expose these "whiners" for what they are -- socialist, liberal oriented individuals! Tha mindset is a piece of our country's political and socio-economic "fabric" ---- just so they know we know who they are!

Well, there are multiple ways of looking at this.

The capitalist way says that when a commodity is scarce, the price rises until demand at that price is satisfied. i.e. The person with the most money gets it.

The meritocratic way says that the item should go to the person with the most talent/skill. e.g. Make up a test and the item goes to the person who scores the highest.

The aristocratic way says that the item goes to a member of a privileged class. e.g. People who are connected.

The elitist variation on aristocracy is that the item can only be possessed by a member of a limited elite. i.e. Only people who purchased an MTR directly are permitted to own one. No sales permitted.

You could allocate the scarce item based on a lottery, etc.

I favor capitalism for allocation of scarce luxury items, such as a ham radio. It is a method which tends to allocate the item to the person who wants it the most. I bid on this kit -- at a price above the original price. I wanted it up to that price. I was out-bid. I didn't want it at the sale price. As someone who wanted it but didn't get it, I'm content with the outcome. I got to choose whether I'd get the radio.

I'd have been less content with a, "$100 to first person to respond," sort of deal, because that's a lottery and I don't get to choose the outcome of a lottery.

I agree with that and see nothing wrong with someone who profits in such a transaction - OTOH, I was lucky enough to purchase my ATS3b from AL7FS, who also didn't want to profit from selling the rig, but wanted to pass the opportunity to experience the rig to someone who may have time to build and enjoy it. I can respect either philosophy, and honestly don't know whether I would sell an unbuilt KD1JV kit at a profit. I don't think so, as I think of the QRPers more as a family, but I certainly wouldn't fault someone for doing so. But there are a lot of wheeler-dealers out there...I'm just not one of them.

I was recently at a QRP meeting and was told by one of the members that he'd sold his MTR after being offered a price he "couldn't refuse". I'll have to admit, I would have been awfully tempted as well....it sold for even more than the subject eBay listing.

About 10 years ago, I had a custom guitar made. I had to wait 8 months for it, and the day i brought it home I was offered a 50% profit. By then, the wait for that luthier had grown to two years, and eventually the wait list hit five years. I know of people who purchased these instruments strictly for speculative value who didn't even play...and there were similar cries in that community that these speculators shouldn't profit from these sales, but the luthier should. The luthier kept raising his price until finally he stopped taking advance orders and his new price finally exceeds the market price - at over 3X what I paid.

In both the luthier's and Steve's case, they both choose how to do their business, and that is how it should be.

As the originator of these kits, let me give you my 2 cents:

Once someone owns the kit, it is thiers to do with as they wish. If they want to resell it via auction, that is thier right too. If someone is willing to pay more then the original selling price, that is also thier right.

However, if someone buys the kit with the sole intention of reselling it at auction to make money on it, that would seem to be a bit unethical. Fortunately, that does not seem to be the case here and the reason he put it on sale was explained in the auction. It was a first run kit, so he has been sitting on it for awhile. BTW, it sold for $185, so those who bought one at the original price got a bargin :)

It is easy to misunderstand what these auctions tell you about value ... the item sells for the price of what two people are willing to pay. Only four people offered to pay more than $130. To sell 250 of them in the two runs, Steve's pricing point was pretty darned good. He also creates a latent demand and a waiting audience to sell off his stock quickly. A commercial-like endeavor would have support and overhead such that actual cost would easily double, and at that higher price point demand would diminish and dry up pretty quickly.

Steve meets a small but insistent demand for highly functional minimalist radios that are challenging to build. I, ... we, ... appreciate what you do with these radios, Steve. I, for one, have carried your radio up 150 mtn peaks so far. In all those SOTA activations, the radio never failed a single time. The typical round trip effort was probably three to four hours which means the radio provided me a LOT of hours of fun.

Keep them things coming, Steve!!

While on the drive home from a business trip - I made a quick stop at "Do it Yourself Electronics" in Needham, MA. Great store if you're ever passing by! Anyway, they carry Pelican cases and I wanted to pick one up for my KX3. After finding the right case, I grabbed the wrong one, paid for it and didn't notice until I got home 3 hours later!

I wanted to put it to use, so now my MTR has a nice hard/weatherproof case!

Here's a photo: http://i.imgur.com/Njmw7T5.jpg

The KK5PY micrp paddle is in the film canister. I'll likely put a few fresh 9V's near the BNC -> RCA adapter and then I'll use the remaining room for wire, and earbuds. And if I ever end up with a nice resonant antenna on 20/40, I could swap out the ZM-2 and put that in its place.

I was pretty happy with how it turned out, though still bummed I got the wrong case for the KX3! Looks like I'll need to just buy it from Amazon...

The 2013 Stew Perry Top Band Distance Challenge events will take place on the following dates:

Summer Stew - June 15/16th
Pre-Stew - October 19/20th
Big Stew - December 28/29th

Go here for the rules: http://www.kkn.net/stew/stew.rules.txt

I'm gonna give it a go this coming weekend in the Summer Stew JUST 'cuz I have nuthin' better to do, I won't be home for the Big Stew weekend in Dec and.....I'm punishing myself for EVER even getting the idea I'd enjoy operating QRP on Top Band (actually I LUV operating QRP on Top Band as it is one of the better "challenges" from; a) developing an antenna system that works, b) operating in contests with all the alligators located close by and c) improving one's score for each event and garnering certificates when one can better existing records, whether at the state, district or national level.
Note to self: living in the low band communications "outback," i.e., west of the Mississippi River, means one can't compete with those that live east of the Mississippi River, but one can enter Western Pacific QSOs in their log that those "east coasters" can only dream about!

Hope to hear and work other intrepid QRP souls this weekend on Top Band! 72, Jim Rodenkirch K9JWV

I finally got my grubby little hands on one of those nice MTR cases for my 1st Gen MTR and started working on building the perfect minimalist portable rig. I ordered a P3K from CW Touch Keyer http://www.cwtouchkeyer.com/P3W.htm and put the posts for the keyer in the front and right side of the case, reamed out the antenna connector for a BNC and stuck an 9v to the side (temporary).

A picture is in my folder in the picture section.

The next thing is to find a small slide switch I can put on the back case as a power switch, something similar in size to the band switches on the top. If anybody has one handy, let me know. I'll probably leave the power connector in place in case I want to run from a different power source than the 9v. I also found that a Lithium 9v won't fit in a standard 9v battery clip so I'm not quite sure how I'm going to attach the battery to the side. Maybe just some double sided carpet tape, its plenty sticky.

Can't wait to get this rig back on the air.

11336. 20M QRP EFHW (Zepp) Antenna Matcher Details

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-06-13 20:22:32 UTC
From: reed2web
Topic: 11336 Message: 11336

This is about construction details for (yet another) 20M antenna matcher. I have uploaded photos, which include schematic and toroid-winding info. This one is a resonant circuit version, not the transformer type.

The design objectives were for it to have low SWR and be very lightweight. For 20M operation the matcher end-feeds an over-tree half-wave wire (34-feet). My 34-foot wire has some taps near the end. The 3.5-foot coax feeder line will function as a counterpoise (in theory). For 40M operation, the matcher will be disconnected from the 3.5-foot coax, and the over-tree antenna will be used as one half of a 40M dipole. The ground side of the coax feeder will be connected to a 33-foot line that will just be run over bushes, but not touching earth.

This concept has been mentioned before on AT_Sprint. That is why I went with it and have provided construction details in the photos.

I might add that I installed a ON-OFF-ON power switch in the MTR. One ON-position is full on. The other ON-position provides current-indication with a LED. The power is dropped through 3.3 ohms (three 10-ohm in parallel). The LED has 100 ohms in series to keep it from getting blown. Although this is not as good as a SWR bridge, it does indicate how much current the transmitter is trying to draw. When in the field, I can tune (if needed) by watching the LED. I find a place where the LED is slightly lighted. This indicates a current that will not fry the output transistors. Note that I have checked the characteristics with a real SWR meter before relying on the above technique, which is primarily for field verification. The info in this paragraph is just for information, not to start any flame wars.

I also use supercapacitors in the MTR to average out the drain on the battery.

The 40/20 scheme seems to work well over a tree in my yard. I plan to give it a try soon in the Colorado wilds.

Hope this post is useful ... Reed K7FLY

I also found that a Lithium 9v won't fit in a standard 9v battery clip so I'm not quite sure how I'm going to attach the battery to the side. Maybe just some double sided carpet tape, its plenty sticky.

Can't wait to get this rig back on the air.

11346. coiling EFHW wire on 20' mast

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-06-15 03:43:36 UTC
From: Paul Womble
Topic: 11346 Message: 11346

I would like to use a single SD-20 telescoping pole for a 20m EFHW deployment. What will happen if I wrap the antenna wire around the length of the pole insteadof having the wire as an inverted-L, wire totallyvertical, etc? I have both a SOTA tuner from Hendricks and a LNR 10/20/40 trail friendly matchbox to chose fromas the matching device.

Thanks!
Paul K4FB

11347. Re: [AT_Sprint] coiling EFHW wire on 20' mast

From: Mike WA8BXN
Topic: 11346 Message: 11347

Hi Paul,

The amount of wire to wrap around the pole would probably not be the same as it would be if it was straight. Why not make a 1/4 wave vertical with one or more radials of a 1/4 wave length. Particularly if you are going to do portable operation you would not have to wind and unwind the pole each time you operate. You would also probably not need any matching device as it would be a resonant antenna with SWR<2:1.

It depends what you mean by wrapping the wire around the pole...

If you mean a few well spaced turns to keep the wire close to the pole
rather than having it wave about in the breeze then it won't have any
noticeable effect.

If you mean wrapping the entire length of the wire around the pole then
as the turns are quite close together it will behave as an inductor,
this might have quite a big effect not only on the resonant frequency
but also on the radiation efficiency. Think of it as a giant "Rubber
Duck" antenna of the type found on handie-talkies.

Paul :

Wrapping it on the pole will likely affect the matching as technically you will be creating a helically wound antenna and thus adding some inductance.

Why not use the pole to put up the EFHW as a sloping end-fed dipole,
or as an end-fed inverted vee, either of these will work fine ?
BTW as a sloper the antenna will tend to favour signals in the direction of the feedpoint.

Sid ...

One web-based EFHW white-paper with lots of math, plots, and experiments showed that a counterpoise of 5% of the wavelength was good. Frankly, there's enough stuff connected to the MTR (earbuds and key) that I did not see much difference in SWR with or without a counterpoise. However, I compulsively used a feed-line of 3.5 feet, and put ferrite beads at the MTR end. You can see these in the photo. I'm not sure that the beads are worth the extra weight. My understanding is that they will not do much good if applied to a position where the impedance is high ...

When checking SWR, I was using an impotent 9v battery. Given the low power and range of my SWR/watt meter, the measurement resolution was low. However, the forward needle went up past one watt, and the reverse needle barely budged after final inductance and capacitance were adjusted. So, I would guess the SWR to be less than 1.5:1. I could get some variance by tapping in at 6-inch intervals at the end of the half-wave wire, although the match was realistically good enough without messing with the fine tuning, in my opinion.

When working up the design, I did start with a 4.7K resistor load, etc. However, in practice, the capacitance ended up being about 70% of the original value. I expect the capacitor and/or inductance would be different for a properly-installed antenna. My antenna was a wire tossed over a tree -- as it would be used in the field.

Thanks for the replies all. I was looking for a way to deploy the pole/wire combo in a low profile configuration to use when we go to the beach. A single 20' pole would not be too bad but I don't want to worry about other people hitting wire (antenna or radials) or having to take multiple supports. Our beaches get fairly crowded.

Look at the Black Widow Antenna, originally designed by WB3AAL,and
copied by WA3WSJ

Details are at http://wa3wsj.homestead.com/BW.html

I generally use a 31' Jackite Pole to support a vertical wire, and a
tuner for 20/30/40 meters. This is for someone who doesn't want to use
a tuner.

They specify radials, but if you take a small ground steak with you, and
pound it and a wire into the sand, perhaps putting somesalt water around
it for conductivity, you should be able to get a "reasonable" match on
40 and 30 meters. You'll need some sort of steakto support the pole anyway.

Hi,

When I have to wind some part of an an antenna because it is longer than the pole supporting it, I always try to make some kind of "zig-zag". That means I wind four turns clock-wise, then four turns counter-clock-wise. On 20m I keep at least 1cm between each turns.
That way, the efficiency is not improved but it minimizes the impedance change.
Also ,always try to keep the "lower half" of a GP or the part closer to the feed-point straight because it is were most energy is radiated.

BTW, if you don't have a ruler graduated in both inches and centimeters, a good approximation of 1cm is Pi/8 inch. Hope this help. ^_^

If room's a problem, you might be able to implement a touch sensor directly on the MSP430 using only the two digital IO cells currently assigned to the keyer plus one resistor: www.ti.com/lit/an/slaa379/slaa379.pdf I wonder how well this would work, it's not a slam dunk. Concerns include: response time of the switch (fast enough for a keyer?), rf noise generated by repeatedly strobing those pins getting into the receiver, and rf from transmitter affecting what the switch sees.

The P3 keyer has built in automatic "calibration" to account for any capacitance present at power on. My wires are about 4 inches long probably before they get to the screws. i.e. if you have your fingers on the key at power on, it won't work.

As does the method described by TI for the MSP430.
But that would take time to get working, and involve
a significant hack to the MTR's MSP430 code.
Unless there's dozens of units involved, probably
best to stick with the P3 keyer that you found.
Or, unless somebody out there is looking for a hobby.

Okay !

A "spy" who works at the postal office has unblock my parcel. hi !
After 85 days, I finally received my MTR. Very very happy.

The box is beautiful and so small.
Steven, you made a wonderful job. Beautiful !

Now I have to start my iron solder.

11367. FS: Rotary Encoder Wart and case top for ATS-4b

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-06-27 01:15:02 UTC
From: rasteenb
Topic: 11367 Message: 11367

I built and installed Mirsolav's rotary encoder kit
<http://diy4fun.blogspot.com/2010/01/rotary-encoder-for-ats-transceiver.\
html> on my ATS-4b.

It worked very well and even scans, but I have decided to restore my
ATS-4b to its original configuration. (I got more used to the non-knob
tuning after building and using the MTR for a bit.)

My installation was not very elegant as you can see from the photos on
Flickr, <http://www.flickr.com/photos/rasteenb/sets/72157634345640375/>
but it is functional. I'm selling the rotary encoder installed in a
small project box and the modified ATS-4b case top. All you'll need to
do is hook it up using the instructions from Miroslav's site
<http://rapidshare.com/files/338957405/Rotary_encoder_for_ATS_series_tra\
nsceivers.EN.pdf> .

$30.00 complete; I'll pay shipping to US addresses.

Cheers,
Rob

11368. A few more FOXii

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-06-27 01:58:07 UTC
From: Dale Putnam
Topic: 11368 Message: 11368

In order to balance the spread of the FOXii, during the summer season,

we are looking for ajust a few more FOXii.. Here's the deal. Go to the webpage, and

find the link to the apps.. fill it out.. send it in.. even if you have never done it before..

the summer season is a great way to gain a bit of experience.. and a whole lot of

fun time... not to mention.. the dreaded butterfly time... but then we all get that..

What say, some of you have been hounds for a long long time.. now's the time to

jump in and be on the other side of the den door.... or is that the other side of the din????
You'll never know.. until you fill out an app.. .. .. ..

Might just as well fill it out.. and .. of course, the committee doesn't have to pick you..

so.. you could just fill one out and be on the standby list.. and that's ok too.

And for the rest of the hounds.. are you really ready????

Have the key contacts polished clean, the antennas all checked over.. and the dust off the earphones? ? ? Really?

We don't do teams for the summer.. just for the winter season.. but daylight is burning..

might be fun to keep your ears open for possible team members ??

More fun.. in 90 minutes.. than you think you can have...

shoot.. I think it is more fun than anything else... with my boots on.. .. .. ..

http://www.qrpfoxhunt.org

Have a great day,

--... ...-- Dale - WC7S in Wy

I suppose I had best let you guys start ordering cases, even though I still have a lot of other things going on at the moment to use up my time. Chances are you'll all order one at the same time, so be patient and I'll slowly get them out as I have spare time to do so.

Keep in mind I only have 100 extra cases and there are potentually 150 people who would want one. I'm counting on at least 50 of you being happy with the rig in an Altoids tin or still unbuilt and sitting in a closet, all but forgoten. I hope you all understand I'd rather disappoint some of you if I run out of cases then to end up with too many.

Cases will come with the flat head mounting screws and bumper feet, but not the red LED lens or felt cloth for over the switches, since you should still have those pieces.

For these cases you can use paypal. Here is an order page to make things simple:

http://kd1jv.qrpradio.com/MTR/MTR_CASE_order.htm

If and when I run out of cases, I'll take down the order page so if it you get a 401 error, thier all sold.

72, Steve KD1JV

11376. ATS-4b Tuning peculiar on 40, 20 meters

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-07-02 03:04:25 UTC
From: rasteenb
Topic: 11376 Message: 11376

I noticed awhile ago that the tuning on 40 meters was 35 Hz +/- 50 Hz.

For example, I can use direct freq entry [DFE] to get the rig to 7.000035 MHz, but not 7.000000 and when I tune it increments as it should, in 50 Hz steps, but to 7.000085, 7.000135, etc.

Similarly, on 20 meters, I can get to 14.000010 MhZ, but not 14.000000.

The remaining bands all zero-out (i.e. 10.000.000, 21.000.000, etc).

Is this on purpose, or did I screw something up?

If I did screw something up, can I fix it, and how?

Thanks,
Rob KA8JBY

Does anyone know when the next release of kits will be?

Hard tell'en not know'en

I probably shouldn't say anything as this always opens up a can of worms, but I've been giving thought to the next generation of MTR's.

I've been evaluating a TI audio processor chip with miniDSP as a possible replacement for the audio section of the rig. It can perform AGC, band pass filtering, sidetone generation (with level control), electronic volume control and headphone driver (either class AB or class D). The only problem is that the chip is in a 5mm square leadless package which can't be hand soldered to the board, so I'd probably have to pre-mount it.

It seems to work pretty well, but I somehow managed to blow out the audio inputs on the evaluation board (which cost me $100) the other day so I'm kinda dead in the water until I figure out how to replace it or build a stand alone test board.

There is a lot of demand for a full function LCD display. I've found a neat little one which is a lot less fragile then the one used on the ATS-4 which looks suitable.

I'll probably migrate to the MSP430G family of processors which support capacitive touch switch inputs. It would be nice to eliminate the mechanical push buttons and add a touch keyer option.

I'll probably add a third band since the 40-30-20 selection is pretty desirable.

Finally, I might add a boost regulator so that a single li-ion cell can be used to power the rig.

I'm not sure how long all this new development work is going to take, but it will be a while...keep tuned!

You know that is an interesting idea: a kick-starter concept where members could send in $20 (or some other number) understanding that all this would do is to allow one to the front of the line (& then pay full price for the radio) if & when the product is released.

That would not pay for your R&D time but it could pay for your parts & protoboards.

Steve, what do you think? George WA1PDY

Wow, with all those ideas, the next MTR might be in competition with the Elecraft K3/KX3 for features! And, all in a box not much bigger than an Altoids Tin!

Keep up the great work, great generation and implementation of ideas, Steve!

Does anyone know when the next release of kits will be?
Hard tell'en not know'en
I probably shouldn't say anything as this always opens up a can of worms, but I've been giving thought to the next generation of MTR's.
I've been evaluating a TI audio processor chip with miniDSP as a possible replacement for the audio section of the rig. It can perform AGC, band pass filtering, sidetone generation (with level control), electronic volume control and headphone driver (either class AB or class D). The only problem is that the chip is in a 5mm square leadless package which can't be hand soldered to the board, so I'd probably have to pre-mount it.
It seems to work pretty well, but I somehow managed to blow out the audio inputs on the evaluation board (which cost me $100) the other day so I'm kinda dead in the water until I figure out how to replace it or build a stand alone test board.
There is a lot of demand for a full function LCD display. I've found a neat little one which is a lot less fragile then the one used on the ATS-4 which looks suitable.
I'll probably migrate to the MSP430G family of processors which support capacitive touch switch inputs. It would be nice to eliminate the mechanical push buttons and add a touch keyer option.
I'll probably add a third band since the 40-30-20 selection is pretty desirable.
Finally, I might add a boost regulator so that a single li-ion cell can be used to power the rig.
I'm not sure how long all this new development work is going to take, but it will be a while...keep tuned!

Steve

The design sounds fab; can't wait for the magic to unfold!

For what it's worth I had to come to terms with soldering a number of QFN packages a few months ago as part of build a OpenHPSDR Hermes board. Normally I'd hand solder SMD parts, but this forced me into buying a $40 toaster oven (from Argos for those in the UK who are interested) and trying a reflow technique out; the inspiration came from this article. Without modification the temperature profile of the oven was perfect, although I used a couple of thermocouples to get a more accurate calibration on the temperature dial on the front of the oven. Aside from a few nerves just before putting the board in the oven the process went pretty smoothly (DAC chips at $100 each make me kind of nervous!). I felt less 'in-control' than soldering by hand - but for a single part I'd be very happy tackling a leadless package....although I appreciate others might differ on their willingness to do this.

Hi all,

my MTR n°244 is finished. Just happy !
Tonight, I have seen the MTR voltmeter don't work correctly. I have two numerical voltmeters and I made some measurements on my power supply.

The MTR says about 2 volts under the real voltage.
How could I calibrate this one ?

Tnx !
Loïc, FY8PE.

I wrote few words on my website :

Hi Philippe, see you by mail ;-)

Ok Steven,
Resistors are all good.

I make some measurement :
- At the end of my power cable I have 10.7v
- At the power point on the PCB I have 8.7v, this is exactly what the MTR read with the battery voltage option.

Still searching a solution...

Thanks !
Loïc. FY8PE.

So,

Power cable : bifilar 20awg wire, lenght 1m.

I did some others measurements :
- Power supply : 10.7v
- End of my power cable and on the MTR entry power jack : 10.7v.
- On Q6 : 8.7v enter and exit and 4.7v to D2 and R24.
- On U7 : 8.7v enter and 4.99v exit
- On U4 : 4.99v enter and 3.3 exit

Power supply, power cable, jack, U7 and U4 : no problem.

I'm at the limit of my knowledge... hi

Loïc, FY8PE.

If you have 8.7V on the power entry on the PCB with a 10.7V supply, then the issue is somewhere in your power leads. 2V drop in the wires or connector(s).

Topic: 11400 Message: 11407

What idiot I am !

I am using a 1N4001 diode circuit in order to reduce the supply voltage or battery voltage.

I've just remembered that the drop voltage is not the same when you make a measurement after the diode circuit with or without a charge !

So :
- Power supply and 6 diodes = 12.4 to 10.2v --> diode dropping = 6 x 0.366v
- Power supply and 6 diodes = 12.4 to 8.2v --> diode dropping = 6 x 0.7v

And from the start I asking myself : "why the diodes don't have a voltage dropping of 0.7v ?" Hi !

Anyway, sorry for this careless mistake !

Power measurements :
- Without any settings at 9v : 1.9w on 30m - 2.1w on 20m.
- Then after according the coils :
- 8v : 2.2w on 30m - 2.5w on 20m.
- 9v : 3w on 30m and 20m.
- 10v : 3.8w on 30m and 20m.
- 11v : 4.6w on 30m - 4.4w on 20m.
- 12v : 5.4w on 30m - 4.9w on 20m.
- 9v current : 36ma in RX - 560ma in TX 30m - 600ma in TX 20m.

Everything works great from the start !
See you soon.

Loïc, FY8PE.

11408. Re: MTR 244 is born.

CORRECTION, IT'S :

So :
- Power supply and 6 diodes = 12.4 to 10.2v --> diode dropping = 6 x 0.366v
- Power supply and 6 diodes + MTR = 12.4 to 8.2v --> diode dropping = 6 x 0.7v

Tnx.
Loïc.

The "magic" of a semiconductor IV curve. Your DMM impedance was just enough to bias them partially up the curve before going near vertical. Good luck! I got my enclosure in the mail today and its as fantastic as I expected.

Why don't you save all those potential solder joint failures and use just one 5 ohm resister? Works so much better for the tx final protection, and still let's the rx work at full potential.
Have a great day,
Dale - WC7S

Subject: [AT_Sprint] Re: MTR 244 is born.

CORRECTION, IT'S :

So :
- Power supply and 6 diodes = 12.4 to 10.2v --> diode dropping = 6 x 0.366v
- Power supply and 6 diodes + MTR = 12.4 to 8.2v --> diode dropping = 6 x 0.7v

Tnx.
Loïc.

The receiver runs from a 5 volt regulator, should
work the same on any supply between 6 and 12 volts.
Resistor would be fine to protect he TX finals, though
not obvious to me how it would be better than the diodes.
Resistor or diodes, should be hefty enough to dissipate
a watt or so.

Hi,

Thanks for comments.
For info, I'm using only 2 or maximum 4 diodes. The 6 diodes circuit is here for extrem solution...

But I will look if I have a 5 Ohms resistor, here in FY I don't have all my tools and components, so I do with what I have... :-)

I have ordered a Boos Buck converter for 4 months now, never received ! :-(. I will be in France in ten days so, I will refind all my tools boxes.

Here are the first two FOXii up for skinning... in the Summer Season of FOXHUNTs

This very next Thursday (local), starting promptly at 0100z (Fri - GMT) or 7 pm MDT, +/- 10KHz from 14.060,

these two skilled, sly, swift foxii, will be emerging from their dens, and it will be up to you to find and grab

a pelt (qso) from each of them. There will be only two, and the following week a different two, continueing for

the entire summer season. 10 weeks, each Thursday. So dust off that qrp gear, oil up them keys, and lets get to it.

Take a look to the sky, to the last thing your shot will touch, until it smacks a FOXii, hopefully deadon. We have only

FIVE DAYS LEFT....

Whew, it has been a long dry summer, my FOX withdrawl was getting unmanageable... how about you?

See you in the pack of hounds... and good luck to all and to all a good hunt.

Have a great season,

--... ...-- Dale - WC7S in Wy

Not obvious, but Dale was at least partially right on both points. If the current is ramping up till the FET's blow, higher currents mean a bigger voltage drop across the resistor and thus less voltage to the finals. But if a quick voltage spike from high SWR is what causes the damage to the finals, then it may be all over before the resistor sees any extra current. On receive, the resistor will have less of a voltage drop at 50 ma than the diodes, allowing you to operate with lower battery voltages. But if your battery is under 10 volts, you probably don't want the diodes or resistor in anyway. Diodes give a relatively fixed voltage drop across a wide range of current draw, so less going on to think about. I'd consider using either method.

Hi Loic, Dale, fellow QRPers,

Congrats Loic on your new MTR. A MTR-MTR QSO between us would be great but Guyane is rare enough so that even with 100W it would make my day.

Dale, I personally prefer diodes in order to make a power drop because they allow you to deduce the input voltage easily. If you have 2 diodes and read 10,4V you know your battery is at 11,8V. With a resistor it is bit more tricky.

About DC-DC converters, for a professional project I ordered step-down LM2596 modules from a chinese provider. They are just great. Great part quality and design. I've ordered 6 at first and I am ordering 50 more...
The same provider sell similar circuits to different prices, I have asked him the differences between each and wait for the answer... These are the one I have ordered :

Hi Yannick,

Yes an MTR-MTR QSO would be just wonderful ! But it will be difficult. Hi !
Your link is interesting and for sure, the DC-DC converter is the best solution. If they don't create HF noise !

73's.

I hadn't seen icstation.com before, they got some neat stuff. Just showed up this year, don't see many reviews, but then nothing bad either. Like dx.com (which I have had good luck with thus far, though build quality from some of their sources is poor), they ship direct from China. Great steer, thanks Yan!
Items 1383 and 1627 are almost identical, even the board silkscreen legends are the same. However the later uses higher quality parts on the output filter, claims 5mv at 5 volts 2 amps out, input voltage not specified. Item 1383 is 30 mv "max" ripple, conditions not specified. I'd spring for the extra $0.36 in cost to get the 1627.
Item 1625 is perhaps even more interesting, allowing you to also set the maximum current. So if you set the pots to 10 volts at 1 amp max and your project has a short or reversed part, this power supply will lower the voltage from the nominal 10 volts until it delivers a maximum of 1 amp. Claims 50 mv of ripple max, and has a higher minimum input voltage (and I suspect may not go quite so high on output). Might want to replace the pots with others that are easier to twiddle, add some meters to monitor voltage and current (check out icstation.com's "digital voltmeter" product category), would make a very handy bench supply.
A search for "LM2596" finds other vendors, such as dx.com, amazon.com,
and ebay.com. Some at dx.com include digital voltage readout but have a lower max input voltage and look like cheap phenolic boards, whereas the ones from icstation.com look like quality fiberglass-epoxy boards.
Could have a switcher only power the output FET's of the transmitter, shut it down when receiving if noise is an issue. Might even have an enable that is fast enough for QSK. The pdf for the LM2596 is on ti.com.

Wow, lots and lots of different LM2596 boards out there, very popular. The LM2596 is about as simple of a switch mode power supply IC as you can get, as shown in the example circuit of the TI data sheet at http://www.ti.com/lit/ds/symlink/lm2596.pdf☐ Disadvantages include a relatively slow switching rate (so bigger parts and slower response, but lower switching losses and easier to work with), and the external freewheeling diode makes it less efficient at low output voltages than a "synchronous" switcher (which has the diode replaced by an active bottom side switch). Only a couple of the LM2596 items on dx.com use the cheap phenolic boards, most look like glass epoxy. There are dozens of vendors for these boards through amazon.com, and even a couple boards at newegg.com. Those with more than one pot probably have the constant current feature. Constant current would be handy for charging batteries or driving high power LED's, in addition to being a nice bench supply. Constant current is not integral to the LM2596, I'd guess it's done with a low side current shunt and an op-amp that overrides the LM2596's voltage feedback resistors somehow. You could drive the ON/OFF pin of the LM2596 directly from a 3.3v MSP430 IO cell. Nothing in the data sheet about how fast it turns on/off, would be a function of how big the output cap is and the startup algorithm, with a switching frequency of 150 KHz it might be several milliseconds. If you do order from icstation.com, you might look at items 1856 and 2150 for a cheap selection of 0805 caps and resistors.

11422. ATS-2 (yes, 2) receive problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-07-08 18:10:54 UTC
From: digicircles
Topic: 11422 Message: 11422

Gang,

Hoping one of you can advise me on possible causes of a problem I'm having in the receiver of my ATS-2. This weekend during a SOTA peak activation it began intermittently blasting my ears with a loud buzz/hum (somewhere around 60 Hz) lasting several seconds. I could kinda sense it coming on as a little bit of "sizzle" or crackle in the audio, and then the buzz starts abruptly and ends just as abruptly several seconds later. It's loud enough to completely obscure any received signals. I was running off a 12V gel cell at the time it was happening. Despite the issue I was able to make more than a dozen contacts, so the TX side appears to be working okay.

Anybody have any ideas on how to track this down?

73, Dave NK0E

I assume it does not happen when the antenna is disconnected. Check the 5 volt and 3 volt power supply rails. Could be some feedback around one of the audio amps, perhaps due to a leaky cap or solder flux or moisture? Hard to debug intermittent problems. Maybe take an insulated probe and mechanically shove stuff around throughout the audio chain, see if you can find a sensitive spot. If it's consistently happening, go through the audio chain with a scope if you have access to one, see in what stage it first shows up. If no scope, perhaps short out the audio signal, stage by stage, till you see where a short stops the problem? That assumes you can figure out which nodes
not to short, where damage to the rig might occur. Just the first stuff that comes to mind, others may have better ideas.

Dale, it happens with a dummy load attached, too, so it's not coming from the antenna.

This weekend during a SOTA peak activation it began intermittently blasting my ears with a loud buzz/hum (somewhere around 60 Hz) lasting several seconds. I could kinda sense it coming on as a little bit of "sizzle" or crackle in the audio, and then the buzz starts abruptly and ends just as abruptly several seconds later. It's loud enough to completely obscure any received signals. I was running off a 12V gel cell at the time it was happening. Despite the issue I was able to make more than a dozen contacts, so the TX side appears to be working okay.

I have an interference just like you describe. Happens whenever my cell phone is near the radio (provided it's on. Never happens when it's off, though).

Is the buzz still in the radio now? Does it do it without an antenna connected? If it appears to be from the antenna, it is the same noise that I hear when the band is open.

Gang,

Hoping one of you can advise me on possible causes of a problem I'm having in the receiver of my ATS-2. This weekend during a SOTA peak activation it began intermittently blasting my ears with a loud buzz/hum (somewhere around 60 Hz) lasting several seconds. I could kinda sense it coming on as a little bit of "sizzle" or crackle in the audio, and then the buzz starts abruptly and ends just as abruptly several seconds later. It's loud enough to completely obscure any received signals. I was running off a 12V gel cell at the time it was happening. Despite the issue I was able to make more than a dozen contacts, so the TX side appears to be working okay.

Anybody have any ideas on how to track this down?

Did you have any other electronics with you on the summit, like a cell phone?

If that is the case, then I would have to suspect an internal osc. caused by....

possibly a bypass cap not connected now.. solder connection come undone...maybe?

Have a great day,

Dale, it happens with a dummy load attached, too, so it's not coming from the antenna.

EXACTLY. I had the very same problem. And Dale in WY pointed that out to me. My cell phone sits on my desk when home, it has a blue-tooth connection to the whole-home phone system. I had my ATS-4b within 18 inches of the phone, and got that buzz every so often. I moved the phone after Dale suggested it, and the problem went away.

Hope that is it, and thanks Fred for the reminder.

I'll have to test this tonight. My cell phone was on and very close to the rig during the whole episode, so it'd be great if that was the source of the problem. Easy to work around, and I don't have to dig around in my radio... :-)

I'll post test results later this evening. Tnx for the suggestion.

From: jgaffke
Topic: 11424 Message: 11434

Tom might have nailed it for you, but here's a few more details. There's a voltage divider from 3.3v to ground across R43=47k, and R38=3.6k if stuffed for 15 meters. That node in the middle gets measured by the processor, should be at 3.3v*(3.6k/(47+3.6k)) = 0.235 volts. Measure that with a voltmeter, check for cold solder joints and shorts and resistor values if it's wrong. Perhaps R38 has a short across it? If the other bands work and all the above checks out, you might try increasing the value of R38, further away from the value of 1k that is specified for the 17 meter stuffing option. Note that the build instructions consistently show 3.6k for R38, but the schematics show 3.9k. Perhaps the firmware was written to expect 3.9k at R38, but the board was kitted up for 3.6k? The next step up is 10k for 20 meters, so you could probably increase the resistance of R38 before getting into trouble.

11436. LM2596 boards on ICStation (was MTR 244 is born)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-07-08 23:53:14 UTC
From: Yannick
Topic: 11400 Message: 11436

Hi Jerry,

This is my last e-mail on the topic as I don't think this group is a place for talking at large about commercial products.

ICstation.com website is only 3-4 months old but I am buying from them for 2 years already. They speak good english and are responsive.
However, don't expect too much from their "technical staff". Like every similar website (except Adafruit or Sparkfun perhaps) they don't really know what their selling, they just move parts.

The "1627" board is of very good quality, very neat assembling, but part quality is very variable with these providers so I will not say anything about the other modules.
The circuit uses synchronous rectification and have a good performances. My friend whit whom I am working on this project has tested them from 26V->5V under 3A and they don't even get warm.

I also bought several MMA7455 accelerometer modules from them. They are identical to the ones I bought from another provider. Good in all respects but not stellar.

By the way, the same provider has a very nice L/C meter too. Seems inspired by L/C Meter IIb from AADE but at 1/3 of the price.
http://xv4y.radioclub.asia/2013/07/08/inductancemetre-et-capacimetre-chez-icstation-com/

73,
Yan - XV4Y.

--- In AT_Sprint@yahoogroups.com, "jgaffke" <jgaffke@...> wrote:
>
> I hadn't seen icstation.com before, they got some neat stuff. Just showed up this year, don't see many reviews, but then nothing bad either. Like dx.com (which I have had good luck with thus far, though build quality from some of their sources is poor), they ship direct from China. Great steer, thanks Yan!
> Items 1383 and 1627 are almost identical, even the board silkscreen legends are the same. However the later uses higher quality parts on the output filter, claims 5mv at 5 volts 2 amps out, input voltage not specified. Item 1383 is 30 mv "max" ripple, conditions not specified. I'd spring for the extra $0.36 in cost to get the 1627.
> Item 1625 is perhaps even more interesting, allowing you to also set the maximum current. So if you set the pots to 10 volts at 1 amp max and your project has a short or reversed part, this power supply will lower the voltage from the nominal 10 volts until it delivers a maximum of 1 amp. Claims 50 mv of ripple max, and has a higher minimum input voltage (and I suspect may not go quite so high on output). Might want to replace the pots with others that are easier to twiddle, add some meters to monitor voltage and current (check out icstation.com's "digital voltmeter" product category), would make a very handy bench supply.
> A search for "LM2596" finds other vendors, such as dx.com, amazon.com,
> and ebay.com. Some at dx.com include digital voltage readout but have a lower max input

voltage and look like cheap phenolic boards, whereas the ones from icstation.com look like quality fiberglass-epoxy boards.
> Could have a switcher only power the output FET's of the transmitter, shut it down when receiving if noise is an issue. Might even have an enable that is fast enough for QSK. The pdf for the LM2596 is on ti.com.

11438. Capacitive Touch keyer

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-07-09 00:34:24 UTC
From: Steven Weber
Topic: 11438 Message: 11438

I decided to see if I could figure out how to make the capacitve touch switches work and the obvious first test application was to implement the keyer.

It's still a work in progess, but I have a basic keyer now working. I learned a lot and found out it might not be practical to implement in the MTR. It's looking like using a seperate processor to handle the switches would be the way to do it.

In the mean time, once I get all the features added to the keyer (Like message memory), I'll post the source code and associated info for building a stand alone memory keyer. This will be easy for those of you who bought one of the TI "launchpad" eval boards. Unfortunately, the chip supplied with the eval board doesn't have the pin oscillator function required. I'm using a MSP430G2452 chip, which is a bit of over kill for this application. I'll have to look to see if there is a suitable 14 pin chip available to use instead.

72, Steve KD1JV

Hmm, might be time to ditch the new tech and play HF radio?
just poking at you, Dave.
been there done that!

Glad this worked out. On a similar note, we had a very bad case of RFI during Field Day this year. We were careful to have "analog" power supplies for everything, BUT,

we had a small "wal-wart" analogsupply for a WiFirouter. it generated a bit of RFI on 20meters, but itdidn't dawn on us thatthe S-7 to S-9 RFI was coming from that "Wal-Wart" supply on 80 and 40 meters. Drats! We had probably <50% of the Q's we might have made had we figured it out much earlier in the Field Day period.

This weekend during a SOTA peak activation it began intermittently blasting my ears with a loud buzz/hum (somewhere around 60 Hz) lasting several seconds. I could kinda sense it coming on as a little bit of "sizzle" or crackle in the audio, and then the buzz starts abruptly and ends just as abruptly several seconds later. It's loud enough to completely obscure any received signals. I was running off a 12V gel cell at the time it was happening. Despite the issue I was able to make more than a dozen contacts, so the TX side appears to be working okay.

Steve, One thing to think about, do these C-switches work when the
user is wearing gloves? If they don't then it could be a problem for
people wanting to use the rig in the winter. Can there be an option to
build with standard mechanical switches please?

There's alway capacitive finger tip gloves from REI. They are intended for people to be able to use their smartphones with gloves on.

<Pedantic Mode = ON>

But they only have REI in the USA and I'm not in the USA.

<Pedantic Mode = OFF>

Yes, I suppose special gloves would work, but it's still a valid point.

Airplane Mode does it for me. Since I use my iPhone for both spotting (when I've got cell coverage) and logging I need it close to my rig. ...Steve/wGOAT

From: Steven Weber
Topic: 11438 Message: 11449

That's one problem with touch switches. If made sensitive enough to be triggered when wearing gloves, they are prone to false triggering.

I'm pretty sure I can make the paddle inputs automatically detect if a mechanical paddle is used by checking the frequency of the pin oscillators. If it's real low at power up, there is a longish cable attached to a mechanical paddle.

A fair amount of experimentation is going to be required before a decision is made one way or the other...

Could it be the paddle input could be through a jack that switches off the cap paddle?

Have a great day,

I've got one of the touch keyer modules from www.cwtouchkeyer.com. I had thought about building it into the same case as my ATS3b, but one of the things that's held me back is that I wanted a way to disable it, as I often use the little ATS with a chunk of non-resonant wire just for listening...probably do this more than actually use the rig as a transceiver.

W0EA recently built one of these into an MTR and reported to me that when powering the module up, the module self-calibrates to "open". If the paddles are held closed when powering up, that effectively disables them, which would be great for my purposes. I haven't had a chance to play around with that yet, but maybe that's some info that would help somehow.

We have a product using these touch ics (the QT1012 series) and they are a PIA. It took a long time to come up with a decent target touch size and we still have issues with false triggering

What do you mean it "wants" to be on 17 meters? Did it used to work on 15?

You could have just had the VFO jump on you. I had my VFO jump on 40m took over an hour to get back down to 7mhz because there's no way to enter in a freq.

It's a known issue, but no solution beyond tuning back to the correct freq range.

I don't know about the ATS4, but on the '3b, the frequency resets to the QRP "watering hole" frequency at power-up. I've powered down and back up for QSY before. I'm guessing that doesn't work on the '4 based on your "known issue" comment, but don't know. Also, the '3b has Direct Frequency Entry via the paddle, although I never use that.

Lee,

The ATS-4B, or at least MY ATS-4B does also have DFE. And I have found it useful. But perhaps part of the "known issue" also disables the DFE. I guess I won't know until it happens to me. Of course I hope I never have the opportunity to learn. <grin>.

6m is open, short skip this morning. Worked Seguin TX from El Paso minutes ago.

The summer fox hunt season begins tomorrow, Thursday evening at 8 pm CDT (0100z Friday, August 12). Your foxes are Paul, K4FB in FL, and Todd, N9NE in WI. The hunt lasts for 90 minutes and takes place between 14.050 and 14.070. Both foxes will operate split (usually up 1 KHz or so) but may go to simplex later in the hunt. A description of the hunt and its rules are found on the QRP Fox Hunt website at http://www.qrpfoxhunt.org/

You are cordially invited to join in on the fun!

Have a great day,

To add to the confusion, "Whatever happened to the 'Get Smart'" shoe phone? That wrist monstercellphone would last about a day under most conditions where I live, and a "family pooch" would think it's a nice chew toy!

When I can dial up my HF rig from my yard on the little cellphone I use now, and even access the local area repeaters, I might go the extra bucks and headaches in figuring out this digital mess.

73's, nice grin overall

I got a similar device and am not impressed by it. Reception is dicey except in close to the towers. The camera in the one I have
is really low resolution. All-in-all, stick with your usual cell phone. Oh, the speaker is rinky-dink and a BT headset is necessary with the
one I have to hear the party on the opposite end. It actually does pair with my 2012 Enclave and will work if close to the tower.
Could be used say in town with a kid who's had a tendency to lose a regular phone. Good for, " Hey Ma, you can pick me up from the Y now." Kurt KC9LDH :-)

Date: 2013-07-14 22:06:19 UTC
From: NAQCC
Topic: 2848 Message: 11467

NAQCC Sprint Wednesday night!

Our July sprint is this coming Wednesday evening local time (July 17, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Thursday July 18, 0030Z to 0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201307.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - check out the prize page on our website.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6710+ members in: All 50 States - 9 VE Provinces - 94 Countries. Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

Morning all.

Well, I finally got all caught up on the trip to Germany. QSL cards are on their way, LoTW logs have been uploaded. And I finally had time to go through the photos and write up the summit activations.

The 3 Germany clubs I visited (X-37 Meiningen, B-14 Schweinfurt and B-10 Bad Neustadt) were particularly impressed with the ATS-4B and micro-key. I could have sold the station for about $400 to $500 a few times over. Along with the 2 ounce EFHWA, fiberglass fishing pole and KI6J tuner, it was a nice sub-1kg station.

Steve, you really should think about re-kitting the ATS4 too, when you get a chance.

Rather than send a large text file to the group, I just did a .PDF, and posted it with my QRZ profile. Anyone who wants to see it can have a look. You can get it by just going to my QRZ profile: www.qrz.com/db/kd9kc/

There is a link is in yellow right below my QSL card photo. Just click on the link that says

"SOTA report from DL/KD9KC - 6 through 24 June 2013 (CLICK)".

And it will open a .PDF with the story and photos.

Right below that is my weather station display. Yes - we did get some rain, and last night 1/4 of an inch too. 2.18" so far this year. That is a lot for us.

Anyone going over to Germany, you will see there are some lovely summits in this report. A few were especially nice. I wish I could have stayed longer and done more.

Enjoy.

Hi,

I am fortunate to have a few qrp kits and I want to first build the one I am most likely to complete successfully. I have limited experience with kit building and the only surface mount kit I have built is a 40m Softrock II, which worked with no probs. So which do you think I am most likely to complete successfully? : Norcal 20, Norcal 2030, MTR Mountain Topper, original Sprint III.

Thanks, 73, Al, N6ZI

This may have been asked and answered.. but I missed it if it did.
With the MTR2, freq selection accomplished with R3 and R4, or BS1 and BS2.
With the higher band in BS1.. as 20.. desire is to have 30m be BS2.
Any resistor into BS2.. from the chart.. brings the radio to 40m.. left blank
the radio goes to 80m...
What needs to be done?

Have a great day,

You need to reduce the value of the resistor a little. 18K seems to be the best value, which can be achived by paralleling the extra 100K across the 22K.

11475. MTR #91 Complete!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-07-19 04:13:51 UTC
From: luke_308
Topic: 11475 Message: 11475

Just finished up my MTR build today. It was my first SMT project and it was challenging, but fun! Only problems I ran into along the way were a misplaced capacitor, which thankfully our junk box at work replaced, and a solder bridge on the key plug wires (my very last solder point!). For soldering I used a Weller temperature controlled iron with a very fine tip, a set of fine tweezers, and a jewelers loupe to check my work. It took me quite a while from start to finish as I worked in 5 or 10 minutes intervals in the evenings or weekends between family and work responsibilities. I don't have an oscilloscope so I skipped quite a bit of the alignment procedures but everything seems to work 100%. For output I seem to be getting roughly 3-4 watts on 20m/40m using a fresh 9v alkaline battery. I did add a locking power switch between the antenna connector and the power plug. It is DigiKey part M2011LL1W01-ND ($5.17) if anyone else would like to do something similar. My regards to KD1JV for producing such a great little radio.

From: Keith Hamilton
Topic: 11479 Message: 11479

Is anyone using Li-Poly batteries with their MTR or ATS? The one I bought is a 500mAh "Sky Lipo" battery. I have not used it much yet so I'm not sure how it will last.

I have the proper charger and a charging bag to be safe. I also store the battery in an Altoids tin when not in use.

One thing for sure you can't beat the size or weight. It is REALLY small! And at 11.2 to 11.4 volts fully charged it is a good match for the MTR. I need to find out how low I should discharge this battery so I don't ruin it.

Highly recommended! Comments?

Keith,

Best bet is to look up the manufacturer's specs on minimum voltage for discharge. Many battery packs have internal shut off when that voltage is reached. If not, to be sure, it might be appropriate to build a fail-safe, or at least a voltage monitor which alerts you when you get near that end point. Nominal voltage is 3.7 volts per cell, but fully charged can be 4.2 volts per cell, so you pack may exceed 12 volts when fully charged. The discharge voltage typically drops to 3.7 volts and stays relatively flat for most of the discharge cycle. Most manufacturers say between 2.7 and 3.0 volts per cell is the critical voltage where you're NOT supposed to discharge any further.

Hope this helps.

3v /cell min discharge. Don't store at minimum voltage or they will start to puff.

Long term storage at 50% charge. I only do it over winter months if I happen to remember.

Charge at 1C rate max.

Keith,

FWIW, I've had good luck with CHEAP Chinese 1.2 Ah LiPo pack that comes with a dedicated charger (which really appears to be the same charger as that supplied with my CHEAP Chinese 6.8 Ah pack).

The 1.2 Ah rating seems a lot more accurate than the highly optimistic 6.8 of the bigger unit.

Small, very light-weight 1.2 Ah seems to be a good match for MTR, and with PCB "Poor Man's Paddle", it all makes for a very light Spartan Sprint station. And yet, the 1.2 Ah appears to outlast the old decrepit operator.

To be on the safe side, I inserted two diodes inline to cut fully-charged voltage to MTR. Can't risk Steve Weber's engineering genius, you know.

Good morning.

I haven't really seen anyone directly answer your question, so I thought I would give it a try.

I have a few of those batteries. I got a 500, 800 and 1300 MAH unit. I have really only used the 800 MAH so far, and have found that it is plenty for how I operate. Since I have not used it to the point that I would call dead, I am not sure just how long it will last. And of course it is YMMV, as your radio and operating habits will be different than mine.

As for how far to drain it - there are a few "opinions". Because they are so cheap, I am not truly worried about mine. However, at some point it may become a safety issue when discharged too deeply.

One of the better web sites for learning about batteries is called BATTERY UNIVERSITY.

http://batteryuniversity.com/

Right there on the front page there is a section called MOST POPULAR ARTICLES. There are currently 3 on Li-Ion and Lithium based battery chemistry. You should find plenty of interesting data there.

One suggestion. I have a few different battery types - and sometimes it gets hard to remember the max discharge levels. So I write it in marker on the battery.

So far Sky Lipo seems to be a good brand. Good Luck.

I've been purchasing my LIPO batteries from Hobby King. I also bought a charger for around $30 from them that handles all kinds of batteries, besides the special balancing needed for the multicell 1500mAh batteries 3 cell LiPO batteries I use for mybAT series rigs. Fully charged they are around 12.6 volts. I use two diodes in line and that knocks the voltage down to about 11.4. They also have a neat in line battery monitor made by Turginy.

I have no connection with Hobby King, they seem to have a good selection at reasonable price and ship fairly quickly, especially if you order from the US warehouse. Lots of battery types and sizes to chose from. They work great with my MTRs and ATS3. Their batteries do come with an unusual connector, but I leave them on and just make up adapters.

OK guys and gals, you know how life gets in the way of fun sometimes? This summer is one of those times. I was one of the lucky ones to get a MTR from the second run. Unfortunately, it is still in the priority mail package from Steve, unopened. I had planned on building it and using it this summer while off from teaching, but the other projects the school district and the xyl had for me haven't left much time to do radio. Still haven't even had the boat out to go fishing yet! I go back to school in a couple of weeks and I know I will not get to it for a while. Knowing that there are others that want the rig now makes me feel a bit guilty for hoarding it, so I will sell it. Now comes the question of how the process will go. Sometimes I've been lucky being the first to respond on an item and then there have been a lot of times when someone beat me to the keyboard. I plan on giving people a chance at it (if there is even any interest). I'll keep track of calls from now until the morning and then draw a random call and give that person first shot at it. If they decide against it, I'll draw again. Now for the price. I am a firm believer in capitalism and letting the market dictate the price. I have no problem with people charging more than what they paid for an item if someone wants it that bad. In this case, though, I paid Steve $126 for it and that is what I'm asking. If no one wants it at that price, I'll put it on eBay and sell it for more. J

I have a another QRP rig that I may sell for the same time constraints as above if anybody is interested. It is an HB1B from TenTec (YouKits).

At some point, I will regret this, but let the fun begin!

OK guys and gals, you know how life gets in the way of fun sometimes? This summer is one of those times. I was one of the lucky ones to get a MTR from the second run. Unfortunately, it is still in the priority mail package from Steve, unopened. I had planned on building it and using it this summer while off from teaching, but the other projects the school district and the xyl had for me haven’t left much time to do radio. Still haven’t even had the boat out to go fishing yet! I go back to school in a couple of weeks and I know I will not get to it for a while. Knowing that there are others that want the rig now makes me feel a bit guilty for hoarding it, so I will sell it. Now comes the question of how the process will go. Sometimes I’ve been lucky being the first to respond on an item and then there have been a lot of times when someone beat me to the keyboard. I plan on giving people a chance at it (if there is even any interest). I’ll keep track of calls from now until the morning and then draw a random call and give that person first shot at it. If they decide against it, I’ll draw again. Now for the price. I am a firm believer in capitalism and letting the market dictate the price. I have no problem with people charging more than what they paid for an item if someone wants it that bad. In this case, though, I paid Steve $126 for it and that is what I’m asking. If no one wants it at that price, I’ll put it on eBay and sell it for more. J

I have a another QRP rig that I may sell for the same time constraints as above if anybody is interested. It is an HB1B from TenTec (YouKits).

At some point, I will regret this, but let the fun begin!

73, Jim K0ESE

Jim,

Put me on the list for $126. I really like Steve's kits. My favorite radio is my PFR-3A. Let's see if I win your MTR. Thanks for the opportunity.

11504. MTR sold

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-07-24 17:42:00 UTC
From: Jim Crooke
Topic: 11504 Message: 11504

Guys and gals,

I ended up with 17 calls to be in the hat from VK land to Russia, Germany, Great Britain and the Americas. Even had offers over the asking price, had to think on those for a second or two. I assigned a number to each call and used a random number generator and it chose John, K5JS.

I wish I had more to offer to you all. Steve, you are a genius. Good luck to each of you if Steve opens up another batch.

11505. Lithiums, ATSs, and, MTRs

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-07-24 18:17:13 UTC
From: WA0ITP
Topic: 11505 Message: 11505

In Steve's post of 2 July he menitoned the possibility of an updated MTR. Among the features included might be a built in buck/boost regulator. It is a great idea to fix the input voltage at 12 volts, or whatever you like. This will be perfect to use with any battery, but especially the Lithium varieties.

For Steve's rigs I've been using a LiFePO4 six cell pack with an outboard buck/boost for well over a year. It removes the concern about overvoltage when the pack is fully charged, and of course still provides the set voltage as the pack discharges under the setting. An inexpensive and lightweight single or 2 cell lipo will make an ideal battery for the new MTR when and if it happens. LiPOs are an excellent battery choice for /P ops.

Someone mentioned Hobby King, I've used them for RC model supplies for some time.

Here's a 3/4 AH single cell LiPO that should work well for 4-6 hours for only $2.88
http://www.hobbyking.com/hobbyking/store/__20386__Turnigy_nano_tech_750mah_1S_35_70C_Lipo_Pack_Fits_Nine_Eagles_Solo_Pro_180_.html

and a 1.2 AH 2 cell for $5.98 http://www.hobbyking.com/hobbyking/store/__17275__Turnigy_nano_tech_1200mah_2S_15_25C_Lipo_AIRSOFT_Pack.html

One caveat: Don't allow a LiPO to discharge to to 3 volts per cell or below. It will be damaged if that happens. If a LiPO cell falls below 3 volts, consider it toast.
http://batteryuniversity.com/learn/article/charging_lithium_ion_batteries

Usual disclamers.

I hope this helps your battery decisions.

Real radios weigh less than a pound.

From: Scott Zastoupil
Topic: 11505 Message: 11508

One option to monitor the battery cell voltages is use one that plugs into the balance taps on the battery pack. It appears the packs Terry posted do not have taps since they go into an Airsoft gun. But most other lipos have taps on them.
http://www.hobbyking.com/hobbyking/store/__409__408__Chargers_Accessories-Accessories.html

A DMM or rig built in volt meter would definitely suffice, but for a couple bucks more you can easily monitor all of the cells. A QRP rig as a load is very tame with these packs and the C rating they have. I use the Turnigy nano techs for airplanes and have had good luck with them. Charge at 3-4C (15-20min charge time) and discharge at 40-50C (or 40-50 amps on a 1000mAh pack). Only slight puffiness after 50-100cycles. Anyway, cheap stuff that works well enough.

As said before, look for the little american flag next to the product to order from the US warehouse to save on shipping cost and time.

FOR SALE:
A complete, working, guaranteed, ready to go with you... AT3a meets specs... actually does better.
Been mounted in two or three different boxes, but now resides in a flip top blue striped home, that
houses both the radio and the extra filters.
More-Photos on request.
It is a fun little radio, been taken on vacation to N. C. so it went through local air worthiness inspections.
Has never been packed around on foot, but give it credit for miles flown.
I want everyone that wants this cool radio to have a chance at it. This is how it will work this time:
I will take offers, direct email, not through any reflector, or by any other means, through Sunday evening 7pm MT or
0100 z. At which time the offers will be evaluated. The chosen winner will be contacted immediately, and the radio will be
shipped via Priority Flat Rate on Monday morning. So, if you make an offer, and expect to win, pay attention to your email
on Sunday evening. This will provide access to all for the rest of today and two more days.
Understand that my financial situation demands this and likely other radios too... and I am not entirely happy with letting
go, so convince me that the little guy will be taken good care of, too. The highest bidder, that doesn't convince me that the radio
will be cared for... won't win. No points aren't taken away for spelling errors, either, but multiple bids from the same originator
lose points rapidly.
Thank you for the bandwidth, and keep responses direct, please.

Have a great day,

--... ...--

Doc,
You might get some 0.1" pitch prototyping board and cut it down to size, search for "2 side pph" on digikey.com. If you can use prototyping board elsewhere it would save money to get something bigger than their smallest size. Digikey (or Mouser) can probably set you up with all the other parts as well.

From: synovial_98
Topic: 11513 Message: 11513

Hi,

I'm new to the group and am looking forward to communicating with fellow AT owners. I've been licensed since 1972, but mostly inactive until about a year ago.

I enjoy the hobby (or is it obsession?) immensely, as I work in addition to QRP many modes and frequencies, including satellite ops.

Looking forward to QSOs via CW with everyone.

Thanks and 73,
Ken

From: Owen B. Mehegan
Topic: 11514 Message: 11514

I am finally going to start building the ATS-4a that I bought from another list member well over a year ago. One less KD1JV kit that will remain unbuilt! Before I start, I was wondering if anyone could dust off that part of their memory and comment on whether the instructions and especially the errata listed in the files section here are valid:
http://groups.yahoo.com/group/AT_Sprint/files/W9CF/

I do have the CD that came with the kit, so I can use the instructions off of that, but if there are errata to consider for them I want to make sure I have those. Thanks in advance!

11516. MTR 20m receiver performance

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-04 06:23:23 UTC
From: warren_3byd
Topic: 11516 Message: 11516

Hi All,

I have an MTR from the first build and I have had plenty of contacts on 40m but always found stations hard to hear on 20m.

I have now done some testing of the performance on both 40 and 20, and found that it needed about 6db more from the signal generator to achieve the same audio level out of the receiver on 20 compared to 40.

I have gone over the receiver front end and I am happy that the correct components and turns have been used and the trimmers are tuned for best performance.

I measured the injection level from the DDS at the top of R18, I had -21dBm on 40 and -33dBm on 20.

All tests were done with a commercial radio generator / analyser.

So the question is, is this difference in receiver performance a feature or a fault?

Hello,

I use an end-fed tuner from betterqrp.com with the LNR precision trail
friendly wire and choke. Works like a charm and the EFHW tuner does have
the little LED to check for SWR. Best of all it covers 20 and 40m.
The betterqrp tuner is also very small...

Gil.

I am going to to repackage my 1st-run 20/40 MTR into the new case I got from Steve at Lobstercon. When I do, I intend to build and endfed tuner and LED SWR indicator inside the case. Looks like there will be room, but it will take some planning.

11523. EFHW and Capacitive Touch Keyer

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-05 01:48:51 UTC
From: Bradley
Topic: 11523 Message: 11523

I posted a picture (ATS3B KZ5W) of my rig taken while hiking the JMT out of Yosemite last week. It's a little beat up - spent a lot of time in the backpack the last couple of years. It's pretty low profile - just have to figure out how to fit the tuner in the case. It's shown with it's optional water proof case (Baggie) and Antenna installation tool (Rock) - I designed the little surface mount cap touch key that takes up zero space in the case. I think I'm going to take my MTR out of the nice case that came with it and go back to the Altoids can, the steel case is a little heavy for the worlds best/lightest backpack rig.

11524. Re: MTR 20m receiver performance

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-05 02:39:35 UTC
From: Yannick
Topic: 11516 Message: 11524

Hi Warren,

First my MTR is built for 30m/20m and I mostly use it on 20m.
I have not noticed this behavior on my MTR and here is my experience with the MTR sensitivity.

When on a quiet band (20m in the mid-afternoon), if I hear on my TS-590s a signal who is just 1S point above the noise but clearly copiable, it will still be copiable on the MTR but deeper in the noise. I guess that means the MDS of the MTR is within 6-9dB of that of the TS-590s.
When the band is noisy it's another story of course, but with its narrow filter and quiet receiver chain, the MTR is never deceiving.
One difference is that being without AGC, on the MTR the signals are just three levels :
- weak (and if there is QSB or noise, too weak)
- good copy
- strong
On a modern receiver with a good AGC circuit, you can usually guess where the S-meter needle will be just listening to the signal.

If have not done A/B comparison on 30m between a commercial receiver and the MTR, but I have never had the feeling it was much less sensitive. The same between 30m and 20m on the MTR.

73,
Yan - XV4Y.

Hi Warren,

With an uncalibrated HP8640B I can clearly hear a signal at -130dbm on both 40 and 20 meters. I have the MTR2.
I would start looking for broken smt caps in the 20M LPF/BPF by unsoldering them from the board. They sometimes are impossible to spot unless you remove them one by one.

Thanks Yan and Tom,

I felt the performance of the MTR on both bands should be similar but without another receiver it was difficult to confirm.

I can hear signals on 20, but it was not until I fed a known signal in and measure the resultant audio output that I realised I had a problem.

I will continue to work on it.
Thanks,
Warren.

I was going to try playing in the Spartan Sprint tonight.

I just turned on my ATS-4B to check it out. 15 - OK. 40m - OK.

20m - not so good. When I set it to 20m, I get a continuous side-tone, and the frequency display shows:

. . 7 MHz. I would interpret that to mean _ _ _._ _ _._ _ 7 MHz.

Is there some kind of master reset I can do, or am I out of luck for 20m tonight? Thanks.

Yep - tried that already. The TX and RX RIT is also showing funny stuff - like 9.9z2.

Just dunno. Very disappointed right now. Glad the dog isn't in the shack, cause I would want to kick him.... and he weighs 155 pounds. He might bite back! <grin>.

Anyone has other ideas - I am game. Otherwise, guess I'll go watch TV or something!

Let's see. #1 - Toyota blew an A/C compressor yesterday. #2 - ATS-4 lost its mind tonight. Anyone know if there is a meteor shower coming tomorrow or something, cause I wonder what #3 will be. <grin>.

Mike - KD9KC.

Hey Mike,

Fiirst, put all the band switches to the far right, unplug the key, then power it up. Step thu the menu.. if that works as it is to.. then change bands.. get all three switches to the next selected band.. see if that doesn't get it back to right, k?

Have a great day,

Nope - didn't work Dale.

I somehow got it reading 65.000.047 MHz. From there, I would step it down to 64.999.997 (yeah - weird). Then I would DFE it to 64.000.097. then exit DFE, step it down twice to 63.999.997, then DFE it to 63.000.097, then exit DFE and step it down twice to 62.999.997, ... until I got it to 14.999.997. Then I DFE it to 14.060.047. It seems to be working, but by this time I am not hearing anything on 20m, so I don't know if it really works or not.

OK - so I turned on the FT5000, and without an antenna attached I can hear the ATS-4B. So it is sending something. I attached the antenna to the FT5000, and I can hear it (@ 10 watts) in the ATS-4B, so it is receiving something. Unclear if it is transmitting any power, or receiving well, as everything is CLOSE! Who couldn't hear 10 watts 5 feet away even without an antenna?

This is the second time I have had this happen to this radio, the first time it was 30m just before I packed it up for Germany, remember? What am I doing wrong? Is this some bug, or something wired wrong, or just me?????

More important, what can I do so that it doesn't happen anymore? It is worthless to me if I can't count on it after a long hard climb up some summit. While I am disappointed that I missed the sprint, it is better than climbing N. Franklin in 100º +F temps only to have 20m die on me.

Anxious to hear your thoughts.

Mike.

This is the third or fourth time I've heard someone having this issue. I had a similar issue with the freq jumping, but it was on 40m. I had to do the same, put in 00000 on the key then step down, then 00000, then step down... for about half an hour to get it back to 7mhz. My freq base is also slight off since that happened, like 7.030.064 or something. Haven't found a way to get it back to 7.030.000. Looks like yours might have done the same thing.

So it sounds like a bug, but I haven't seen a fix for it yet.

Yes, it is a bug and I think it was fixed, but can't remember for sure. I don't belive it was a problem for the 4A or 4B. It was most likely to happen when coming out of calibration mode. There might have been something else which corupted the last used frequency registers when some unique sequence of events happend. Unfortuately, I did not include a method to clear those registers if they got corupted and once something gets written to them, it stays there.

The firmware in the files section will have the latest version which would clear up the problem for now and hopefully keep it for occuring again. If you can't reflash the chip, I would be happy to do it for you for return postage.

Thank you - thank you - thank you.... you really don't know how much that helps. You see, things like this happen to me all the time, and when I go to fix it I get that "we've never seen anything quite like this before" answer.

So while you haven't provided me a fix, you have at least confirmed that I am not alone. <grin>.

My solution ended up being the same as yours, and my last two digits are either .047 or .097.

Can you identify any cause? The first time I had it happen was on 30m, and Steve got it fixed for me before I had to pack up for Germany. I only used it about 3 times in Germany, and it worked great. I could have sold it several times over for twice what I paid. So at least it didn't hang me there. But last night I was going to try it in the Spartan Sprint. 20m is the band to start with there. And somehow it went to _ _ _ . _ _ _ . _ 47 on the display, and has a continuous side-tome in the ear buds.

I played around with it, trying turning it on and off, flipping switches and even trying switch combinations. Somehow I got it to read 65.000.097. From there, like you, it was DFE to 65.000.097, then step down, then DFE to 64.000.097 again, step after step. The contest had about 30 minutes left when I finished. I made 4 contacts.

It seems to be working, but now I am worried - what next? I don't think I can trust it for the purpose I bought it for, a very hard summit where my 2.5 pound FT-817 is too heavy. Was planning for late Sept or Oct, but I will put that off for now, no trust in my gear.

So thanks for confirming you were in exactly the same position. We may not be happy, but we have each other. <grin>.

Mike - KD9KC.

Hi steve.

Thanks for the offer. It may be in the mail to you in the next few days.

Please note - this is the second time. I sent it to you last time, you got it back to me just before I left for Germany. It was the 30m band last time. This time 20m.

I was just tuning the frequency up or down when it happened, don't know what I could have done to cause it. Or prevent it.

I hope you can figure it out. Will let you know when it is on the way. Thanks very much.

11538. ATS III ("Down" function quit working?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-08 22:14:14 UTC
From: wlinn.linn
Topic: 11538 Message: 11538

Can't figure this one out and not exactly sure how to check the switch function. Looks to be a simple off and on momentary function with both contacts wired in parallel? I built this kit in '05 or '06. Had it in to Steve once for repairs due to my swr boo-boo. I still use it by setting the frequency from the "Enter" function on the menu and can tune "UP" using the button but not having the "DOWN" function makes it tough to "Hunt and Pounce."

Anyone have a suggestion before I ask Steve if he will fix it again?

Thanks,
Bill W7WEL

Try jumpering out the switch and if it starts to tune down, then the switch needs to be replaced. If it doesn't maybe the port got zapped and the processor needs to be replaced. But if that happens, usually it will not stop tuning, so my bet is the switch wore out.

NAQCC Sprint Tuesday night!

Our August Sprint is this coming Tuesday evening local time (August 13, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Wednesday August 14, 0030Z to 0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201308.html

There you will find all the details as to time, frequencies and other important information.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

Dale, WC7S, offered to replace the switches and check it out. (Did the switch jumpering this AM, no change.) I had already checked the continuity and switch function with an ohmmeter and it showed switch action all the way to the chip. I'm still hoping that it is just a switch and not the processor.

Just in case, are those 20 pin processors still available?

Bill,

In that case, it is possible the chip port got blown somehow. Another thing to check is to make sure the pull up resistor is working, but that usually results in a "stuck switch" condition where it keeps tuning and doesn't stop.

Unfortunetly, I don't have any more spares of the 20 pin version left. They got hard to get at one point and I haven't looked to see if they are available for a couple of years.

Bill,

I suggest you measure the voltage across the switch when the rig is operating. Should be about 3 volts, then go to ground when you press the switch. Make sure the MSP430 pin is soldered down good. Maybe probe the MSP430 pin itself while operating the switch.

If the MSP430 pin is flipping from 3v to 0 when you press the switch but that function is not working, then you probably need to replace the MSP430 as Steve suggests. Looks like Digikey has 1200 in stock, you can buy only one if you wish.

http://www.digikey.com/product-detail/en/MSP430F1121AIDW/296-13457-5-ND/486372

Programming it will take the old parallel port programmer, I don't have one. Perhaps somebody else in the group could program it for you.

11544. BNC jack for ATS-4 kit

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-12 21:06:53 UTC
From: Owen B. Mehegan
Topic: 11544 Message: 11544

I seem to recall that someone on this list had small BNC jacks that could be used with the ATS-4 kits in place of the original RCA jack. Dale, I thought it was you but I sent you an email directly and didn't hear back (maybe I just had the wrong address). If any are still available, I think I'd like to buy one!

11547. voltage control for the MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-12 22:32:56 UTC
From: cloud runner
Topic: 11547 Message: 11547

Feedback from a user on SOTA peaks ... I think Steve said that he wants to incorporate some sort of voltage contrller that can be adjusted to and hold any given voltage, perhaps something that operates like "Anyvolt"

Just wanted to comment with regard to that, I like to have two different voltages readily available to me, one for tuning up and one for operating. (I achieve this less than elegantly with a center off SPDT toggle and some diodes for reducing the voltage from my 3S LiPO).

Radio has always worked well, by the by ... though it has seemed odd to me that throwing the band switches does not result in a band change until I touch the menu button. Throwing the switches to change bands and transmitting before touching the menu button does not yield a good result.

73, fred - kt5x

11550. RE: [AT_Sprint] BNC jack for ATS-4 kit

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-13 01:00:07 UTC
From: Dale Putnam
Topic: 11544 Message: 11550

Hi Wendell, That becomes an issue with you have more than one of Steve's great radios. They all use different sizes:3 - .7mm3b - .7mm4 - 1.3mm
4a - 1.7mm4b - 1.8mm
On my bench I have an octopus with all of the plugs on on cable. Not a good idea, outside of a controlled environment and on a current controlled power supply. On a couple of chargers, I have an adapter to move from one to the other. And for the quick grab radio, I have a full setup only for that radio.. and an adaptor to the next smaller equipped power pack. Confusing? Maybe, but not so much if they are either color coded with tape, tiewraps, or markers. I've often thought about standardizing on one size fits all.. except for the 3 and 3b.. it would work. But then I wouldn't be as readily able to plug is someone else's radio. And it is fun to bring them all up on the airat the same time... add in the Tribander and the PFR3, with one each 3a, 3b, 4, 4a, and 4b.. and you can have more rx to listen to than your ears can keep up with.. SO7R... but grabbing the right key.. is a challange.
I don't do that very often... it makes my head hurt.

Have a great day,

>

Here follows a similar concept that may be of interest to a few folks:

Instead of diodes I use a 3.3 ohm resistance. In the tuning mode (resistance in series), this allows the voltage to vary as a function of current (more current means lower voltage for the radio, meaning less current on the output transistors). I also have four LEDs in series with a limiting resistor on the radio voltage so that the LEDs (drawing about 2ma) roughly indicate the voltage in the tune-mode (with the 3.3 ohm res). If no SWR indicator is available, I can use the brilliance of the LEDs to know if the current is too high (before flipping the switch) to full power mode.

Why 4 LEDs instead of one? (1) they give better resolution of voltage indication at 7-12 volts and (2) they are just bright enough to illuminate a pad in the dark where I write down call signs.

Hi,

Following a discussion about what parts could be of interest for the HAM radio community, one of my providers informed me he has now Bs170 in stock.
I don't know how good is the price. What I know is I have bought many times from this provider directly or via the website, and I have never been deceived.
All parts are not top quality, but they are never bad.
Service and communication are the best among the chinese providers I know (still they are sellers, not engineers).

11554. Re: voltage control for the MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-14 14:47:10 UTC
From: reed2web
Topic: 11547 Message: 11554

I an including the following schematic in case my original post was not clear or complete enough. I hope this email retains constant-space font so that the diagram below makes sense. Don't forget to get the anode (plus) in the right direction for the LEDs. For the 3.3 ohm resistor, I used three 10-ohm resistors in parallel. In total, they should be able to handle at least (or close to) one watt.

Not shown, but I also have supercapacitors across pwr+ and pwr- to render more power out from batteries, especially after 3/4 used up.

```
SPDT Switch (center off)
Norm
/ o-----------------------------+
pwr+ -->--+---o Test |
| o------+----3.3 ohm-----------+---->--- radio+
| | |
1000 ohm | |
| +--100 ohm----LED------+
LED Indicates
| Current
LED Indicates to Radio
| Battery for SWR
LED Voltage Adjustment
|
LED
|
pwr- -->---------------------------------------------->--- radio-
```

I assume you've charged the battery already. All of the high power chargers that I have require the main leads AND balance leads to be connected. Since you have the main leads hardwired, it seems like you loose access to the power lead pair. Maybe an internal diode will still allow charge access via the power connector. Does your charger allow you to charge via the balance taps ONLY?

The high power chargers supply most of the charge current via the main power leads and sink and/or source current on the balance taps to level the individual cells. The smaller wires of the balance leads can't handle the current on large packs when charging 1C or more (Ie. 5amps+)

Yeah, I have not drained the battery enough to charge it yet (it came full). I'll update when we get there!

When the voltage gets too low for the radio to operate correctly, the keying gets ragged, the rx audio gets weaker and ragged.The display fades. By then,... you need to either find another battery... or whisper "72"

I think he's talking about the battery voltage. The radio should operate well below the 9V low voltage limit (3v/cell) of a 3 cell LiPo, so there's no easy way to know without testing the battery. But that's pretty easy. I have a number of these little LiPo battery checkers (like eBay item 290817872773). There' a bunch of similar versions out there, and your local hobby shop probably has them too. Just plug it into the balance connector and read the display. I use them with my RC stuff and my QRP kit. Cheap, light, and small, they are easier to lose than keep track of :)

11565. SMK-2

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-20 18:01:28 UTC
From: k4byf050431
Topic: 11565 Message: 11565

A couple of months ago I sent an sase to the California address listed in the SMK-2 manual for several missing smd's from my kit. So far no reply. Is there another source for smd components so I can finish the project??

11566. MTR build question

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-09 23:42:47 UTC
From: todd.thompsen
Topic: 11566 Message: 11566

I am having trouble identifying which is pin one on U1 and U3, identified as "612". I have the two chips in hand, viewing under a magnifying lens. I can read "SA612A" and the subsequent lines, but do not see a dot or indentation to identify which is pin one. If I'm reading it like a book, is it the upper left hand corner? Any help would be appreciated, this is my first SMT project.

Thanks,
Todd

Topic: 11566 Message: 11567

Hi Todd, Look at the top edge of the ic, to see a tilted edge, one that is slanted towards the legs on that side... Then look at the layout, there is a side shown with a heavier inked or darkened side.. that makes it right.
Good luck,
Have a great day,

Todd,

Look for a bevel on one edge of the chip, pin 1 will be at the top left side.

Todd,

In addition to the correct information for looking for the bevelled edge, in this particular instance you can use the lettering for the manufacturer 'NXP' you'll find this lettering at a different orientation to the rest of the writing on the chip. Pin one is nearest to the NXP lettering.

Hope this helps, good luck with your build!

Only if you hold the IC with the bevel on the left... The point here is that the beveled edge is always the side of the IC that includes pin 1. Once you have that, the SMT ICs follow the same pin out designations as a thru-hole part. Labeling (on some ICs) can vary. The beveled edge of the body molding does not.

11573. Two for one trade

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-21 16:53:52 UTC
From: philip_graitcer
Topic: 11573 Message: 11573

I have two built MTRs, one from the first run, the other from the second run. The first run is 20/40, the second is 20/30. Both were built by me and they work fine, putting out 4-5 watts on bands (12V). They are in the Weber metal cases. They have been used, but are cosmetically flawless.

I wish I had one rig that would allow me to have multiple bands. I already have an AS3b, so I would like an ATS4.

So I would like to trade BOTH MTRs for a built or unbuilt ATS4, preferably second run.

Anyone interested in such a trade?

At this point I am not interested in selling them or splitting up the pair. Just a trade (if there is a difference in total kits costs, we can work that out).

Phil, W3HZZ

11574. Spare .01 uf cap?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-21 17:53:00 UTC
From: Owen B. Mehegan
Topic: 11574 Message: 11574

Per the errata for the ATS-4a build that I'm doing, C46 is supposed to be a .01 uf cap, but a .1 uf is provided. Does anyone happen to have a spare .01 0805 SMT cap they could stick in an envelope? It seems like that would be the easiest way for me to get one :) I could send a SASE!

11577. AOK-BL8S - Battery Voltage Tester and Low Voltage Buzzer Alarm

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-21 21:17:01 UTC
From: ke7ngo11
Topic: 11577 Message: 11577

Has anyone used the AOK-BL8S - Battery Voltage Tester and Low Voltage Buzzer Alarm? It looks like it could be nice for LIPO and LIFE minimum voltage detection. Also be good for determining if you need to engage a diode on a 3S LIPO battery to reduce voltage for your ATS radio.

11579. ATS-4b blind display - help!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-22 13:48:24 UTC
From: Guido
Topic: 11579 Message: 11579

My beloved ATS-4b did not survive falling down to the ground from the table. The display is blank, the TX/RX still works, the display shows no vislible damage. Backlight OK.
Need help!
The type is LCD GRAPHICS EADOGM123x-5
- who ist the manufacturer? or where can I buy an replacement
- Datasheet?
- is there a Test-Mode for the display? how to activate?
- how can I verify if the display is damaged or the processor, can I measure the data stream from proc to the display at which pin?

Any help very welcome!
Thanks
Guido

Subject: [AT_Sprint] ATS-4b blind display - help!

My beloved ATS-4b did not survive falling down to the ground from the table. The display is blank, the TX/RX still works, the display shows no vislible damage. Backlight OK.

Need help!

The type is LCD GRAPHICS EADOGM123x-5

- who ist the manufacturer? or where can I buy an replacement

- Datasheet?

- is there a Test-Mode for the display? how to activate?

- how can I verify if the display is damaged or the processor, can I measure the data stream from proc to the display at which pin?

Any help very welcome!

Thanks

Guido

Try reseating it in the socket, it can pop out fairly easialy.

The display is of German manufacture, google the part number and you should find a local distributer. The data sheet is also available on line.

http://www.qrpkits.com/index.html

Several Steve Weber designs are readily available.

No waiting for the next build.

For multiband portable ops, the pfr3 is a very fine rig.
Documentation and performance are excellent. A internal z-match tuner and battery case reduces backpack requirements.

Download the manual for more info.

The Yahoo Group is here:

http://groups.yahoo.com/group/pfr3_group/

Scratched my "build-something" itch.

Thank you for the info. I have looked into the pfr3 and it is similar to my kx1. I may end up building one while I awaiting for a chance at the next release. kR6AI

11584. New 160/80 meter transceiver design - kit

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-23 01:18:21 UTC
From: Steven
Topic: 11584 Message: 11584

Hey Gang,

With winter on the horizen, you might remember that last year about this time I was hoping to offer a simple 160/80 meter rig, but due to technical difficultes - basically a good idea which didn't really work - I was unable to offer it.

The problem was the makeshift software DDS/PLL I was trying to use just didn't cut it. That problem has been solved by the Chinese. For the unbelievable low price of about $6.00 and $1.00 postage, you can buy direct from China an actual AD9850 DDS board. With one of these in hand as the core, I preceeded to reserect the 160/80 rig project.

As a bonus to using a DDS chip capable of up to 40 MHz operation, the receiver now tunes 0 to 40 MHz! It's a direct conversion detector, so all modes can be received. However, no preselector is included, and it seems it's happy to hear signals which are at the 3d harmomic of the LO, but that's a minor issue. When used on 160 or 80, the transmitter LPF solves that problem.

Anyway, here's the deal. I'm thinking of making 50 board kits available. This design uses all through hole parts so it can eventually be marketed to the unwashed masses. I haven't figured out a price, but I think $65 is a good number for now, with you buying the 9850 board and a 2X16 LCD direct from China for about another $10.00 or less. That would save me from making that investment. The board is sized to fit into a qrpkits.com "premium" aluminum case.

For more info, a preliminary manual (less construction details, as I haven't gotten that far yet) is available here :

http://kd1jv.qrpradio.com/mbdc.pdf

It contains some photos of my prototype, the schematic, board layout and operating instructions. I'm not quite done tweaking the circuit or the firmware, but I should have that done fairly soon. At this point I don't see any show stoppers.

For this project I'll take reservations for those who DEFINATELY want one. Let me know Thanks!

Steve KD1JV

I've never used a KX1, but it looks similar to the K1 which I HAVE used.

For whatever reason, it seems to me that the AT-Sprint series,and the PFR is almost a copy of the AT-Sprint, has a much better receiver than the K1.

That's my impression - I've not run any stats on either the K1 or my "original" AT-Sprint.

Hey Gang,

With winter on the horizen, you might remember that last year about this time I was hoping to offer a simple 160/80 meter rig, but due to technical difficultes - basically a good idea which didn't really work - I was unable to offer it.

The problem was the makeshift software DDS/PLL I was trying to use just didn't cut it. That problem has been solved by the Chinese. For the unbelievable low price of about $6.00 and $1.00 postage, you can buy direct from China an actual AD9850 DDS board. With one of these in hand as the core, I preceeded to reserect the 160/80 rig project.

As a bonus to using a DDS chip capable of up to 40 MHz operation, the receiver now tunes 0 to 40 MHz! It's a direct conversion detector, so all modes can be received. However, no preselector is included, and it seems it's happy to hear signals which are at the 3d harmomic of the LO, but that's a minor issue. When used on 160 or 80, the transmitter LPF solves that problem.

Anyway, here's the deal. I'm thinking of making 50 board kits available. This design uses all through hole parts so it can eventually be marketed to the unwashed masses. I haven't figured out a price, but I think $65 is a good number for now, with you buying the 9850 board and a 2X16 LCD direct from China for about another $10.00 or less. That would save me from making that investment. The board is sized to fit into a qrpkits.com "premium" aluminum case.

For more info, a preliminary manual (less construction details, as I haven't gotten that far yet) is available here :

http://kd1jv.qrpradio.com/mbdc.pdf

It contains some photos of my prototype, the schematic, board layout and operating instructions. I'm not quite done tweaking the circuit or the firmware, but I should have that done fairly soon. At this point I don't see any show stoppers.

For this project I'll take reservations for those who DEFINATELY want one. Let me know Thanks!

Steve KD1JV

Hey Gang,

With winter on the horizen, you might remember that last year about this time I was hoping to offer a simple 160/80 meter rig, but due to technical difficultes - basically a good idea which didn't really work - I was unable to offer it.

The problem was the makeshift software DDS/PLL I was trying to use just didn't cut it. That problem has been solved by the Chinese. For the unbelievable low price of about $6.00 and $1.00 postage, you can buy direct from China an actual AD9850 DDS board. With one of these in hand as the core, I preceeded to reserect the 160/80 rig project.

As a bonus to using a DDS chip capable of up to 40 MHz operation, the receiver now tunes 0 to 40 MHz! It's a direct conversion detector, so all modes can be received. However, no preselector is included, and it seems it's happy to hear signals which are at the 3d harmomic of the LO, but that's a minor issue. When used on 160 or 80, the transmitter LPF solves that problem.

Anyway, here's the deal. I'm thinking of making 50 board kits available. This design uses all through hole parts so it can eventually be marketed to the unwashed masses. I haven't figured out a price, but I think $65 is a good number for now, with you buying the 9850 board and a 2X16 LCD direct from China for about another $10.00 or less. That would save me from making that investment. The board is sized to fit into a qrpkits.com<http://qrpkits.com> "premium" aluminum case.

For more info, a preliminary manual (less construction details, as I haven't gotten that far yet) is available here :

Subject: [AT_Sprint] New 160/80 meter transceiver design - kit

Hey Gang,

With winter on the horizen, you might remember that last year about this time I was hoping to offer a simple 160/80 meter rig, but due to technical difficultes - basically a good idea which didn't really work - I was unable to offer it.

The problem was the makeshift software DDS/PLL I was trying to use just didn't cut it. That problem has been solved by the Chinese. For the unbelievable low price of about $6.00 and $1.00 postage, you can buy direct from China an actual AD9850 DDS board. With one of these in hand as the core, I preceeded to reserect the 160/80 rig project.

As a bonus to using a DDS chip capable of up to 40 MHz operation, the receiver now tunes 0 to 40 MHz! It's a direct conversion detector, so all modes can be received. However, no preselector is included, and it seems it's happy to hear signals which are at the 3d harmomic of the LO, but that's a minor issue. When used on 160 or 80, the transmitter LPF solves that problem.

Anyway, here's the deal. I'm thinking of making 50 board kits available. This design uses all through hole parts so it can eventually be marketed to the unwashed masses. I haven't figured out a price, but I think $65 is a good number for now, with you buying the 9850 board and a 2X16 LCD direct from China for about another $10.00 or less. That would save me from making that investment. The board is sized to fit into a qrpkits.com "premium" aluminum case.

For more info, a preliminary manual (less construction details, as I haven't gotten that far yet) is available here :

http://kd1jv.qrpradio.com/mbdc.pdf

It contains some photos of my prototype, the schematic, board layout and operating instructions. I'm not quite done tweaking the circuit or the firmware, but I should have that done fairly soon. At this point I don't see any show stoppers.

For this project I'll take reservations for those who DEFINATELY want one. Let me know Thanks!

Steve KD1JV

Hey Gang,

With winter on the horizen, you might remember that last year about this time I was hoping to offer a simple 160/80 meter rig, but due to technical difficultes - basically a good idea which didn't really work - I was unable to offer it.

The problem was the makeshift software DDS/PLL I was trying to use just didn't cut it. That problem has been solved by the Chinese. For the unbelievable low price of about $6.00 and $1.00 postage, you can buy direct from China an actual AD9850 DDS board. With one of these in hand as the core, I preceeded to reserect the 160/80 rig project.

As a bonus to using a DDS chip capable of up to 40 MHz operation, the receiver now tunes 0 to 40 MHz! It's a direct conversion detector, so all modes can be received. However, no preselector is included, and it seems it's happy to hear signals which are at the 3d harmomic of the LO, but that's a minor issue. When used on 160 or 80, the transmitter LPF solves that problem.

Anyway, here's the deal. I'm thinking of making 50 board kits available. This design uses all through hole parts so it can eventually be marketed to the unwashed masses. I haven't figured out a price, but I think $65 is a good number for now, with you buying the 9850 board and a 2X16 LCD direct from China for about another $10.00 or less. That would save me from making that investment. The board is sized to fit into a qrpkits.com "premium" aluminum case.

For more info, a preliminary manual (less construction details, as I haven't gotten that far yet) is available here :

http://kd1jv.qrpradio.com/mbdc.pdf

It contains some photos of my prototype, the schematic, board layout and operating instructions. I'm not quite done tweaking the circuit or the firmware, but I should have that done fairly soon. At this point I don't see any show stoppers.

For this project I'll take reservations for those who DEFINATELY want one. Let me know
Thanks!

Yep, you just need to add a LPF to keep the broadcast stations out of it, due to it hearing stations at the 3d harmonic.

Steve,
Put me down for one. Can it tune the 600 meter band when we get the final green flag from the FCC?

Wow, thanks for the great responce. All 50 inital boards are now spoken for. I'll try to get back to everyone with a confermation soon.

But now I have to get really busy and clean up the last details, order boards, order parts, finish the instructions, ect, and that will take a few weeks.

The AD9850 module and LCD are available from ebay from a number of sellers. I just sort of picked one at random from the listings which showed up on the first page. Just search for AD9850 DDS and it will come up. There are actually two versions, you want the skinny one with a single row of pins along the long sides.

I'm not sure exactly who I bought mine from, there seems to be at least three different names referenced. It took about 10 days to get it from China.

Any 16 character, 2 line LCD will work. The one I used has white characters on a blue background. You might get one from the same seller as the DDS module. Because thier cheap, you might want to get two, the one I have has some missing collums which might be why thier so cheap.

Thats all for now, back to work!

Hi Steve,

Missing rows and columns is ususally a symptom of contamination between the board/glass and the elastomer interconnet. I have had success removing the bezal and cleaning all surfaces with IPA.

Regards,

Andrew Gulbrandsen

No MTR here, but a 9V Akaline on the ATS-4a gave me about 2w into a dummy load. The 9v surprised me so I ordered a small 9v enclosed box with a switch and leads from China via eBay. I just need to add the correct power connector for the ATS4. I'll probably do power poles since I have one of those for the rig.

Like this:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=271245030885

I like that you found an Li-Ion as 9V. It does not have the capacity of the Alkaline, but it does not have the drop-off curve either. You may get shorter operation, but at 2w for the duration.

Does it have under voltage and over current protection built in?

Here's the battery info:
http://www.all-battery.com/Li-ionRechargeableBattery-30593.aspx

I was hoping for an estimate on how the initial power output (2W?) would
sag over a period of 60 mins operating with the 500mAh 9V battery.

I think I'm going to order a couple of the batteries and give them a try.

Thanks & 73,
Barry N1EU

That was based on a 9+v battery. Looking at those specs it seems the
nominal voltage of that battery is 7.7v. 8.6v max charge. So not
really "9v", or I could be reading incorrectly.

Yeah, as Chris noted, that isn't really a 9v battery. I would think that
would limit your output below 2w for sure.

Just a guess, start with 9V and 2-3 watts end with 8V and 1-2 watts.

If you use a tuner, another strategy, tune using a 9V alkaline, then plug in your 500mAh 12v Li-* battery and have between 4 and 5 watts for the whole hour.

Unfortunately to go Li-Ion you have to get a bigger battery. A pack
like this:

http://www.all-battery.com/li-ion18650111v2600mahrechargeablebatterypackwithpcbprotectionandhitecconnector.aspx

Need a charger as well.

I think a few people using these rigs are using Li-Po packs.

I recently upgraded my MTR setup to a 850mAh 3S (11.1v nominal) battery:
http://www.w0ea.us/2013/08/upgrading-mtr-we-need-more-power.html

At full charge I was getting 6w out into a dummy load but 20m was a little
touchy with oscillations. I think I might have installed an incorrect
capacitor in the output filter, but otherwise its working well, and will
last for a very very long time.

I just bought one of these:

http://www.ebay.com/itm/Plastic-Battery-Storage-Case-Box-Holder-for-3-x-18650-Black-with-6-Wire-Leads-/390637835176?pt=LH_DefaultDomain_0&hash=item5af3d453a8

I happen to have a flash light that uses 18650s and I can use that as a charger.

The only issue is that I need batteries with PCB protection built in. That adds a couple mm to the length.

That auction does not spec dimensions so I do not know if it will fit in an Altoids tin.

No, but I assume it just monitors the voltage for you? I have got into the habit of checking my voltages on the MTR pretty regularly but I have not really used mine yet so I'm not sure what kind of life to expect out of it.

I believe a typical Alkaline 9v battery is 900mAh. If you are experienced with operating with that battery then you'll have a good idea how long this one will last. You'll just get a bit more output.

Barry,

I use a 2S 1000mAh LiPo, its not an awful lot bigger in volume than a PP3 block battery. I can easily do a SOTA activation until the pile up runs dry. I haven't tried doing multiple activations between charges but the recharge time has always been very short suggesting that I haven't used very much capacity.

My battery cost £7 (~$10US).

I even worked a US station with MTR#131 whilst using the battery ;)

My SOTA activations with an MTR seem to last about 30 minutes. I average about 4 mAH per QSO, based upon what the charger tells me when recharging my 3S LiPO's. 3S are 3 cells rated 3.7 volts, but fully charged, the 3 cells are about 12.5 volts. Most of the discharge is between 11.1 and 11.6 volts, however, and I am getting 5 watts out at 11 volts. Measured voltage drop upon key down is only a few hundreths of a volt.

If I am going out for just one SOTA peak in an activation, I use my 180 mAH 3S LiPO. It is only about half depleted during an activation with an MTR, typically 30 QSO's. The battery is much smaller than a typical nine volt battery, weighs 23 grams (that's less than an ounce), recharges 500 times, and costs $2.85.

If I am going to do two or three peaks, then I take my 300 mAH battery which weighs 38 grams.

Can't imagine using the nine volt batteries. Cost alone is the deterrent, but why sacrifice so much power out?

A typical Alkaline 9V is nearer to 500mAh - 600mAh, cheaper ones even less. As far as power sources for transceivers, they aren't very good, but hey, it's fun to experiment and carrying a 9v battery as a back-up could be a great 'get out of jail card'.

Andy,

This is not related to Steve's kit but what you told interests me a lot.
I have a Kenwood TH79 handheld that showed missing lines from the first weeks I brought it in VietNam. I guess the tropical climate was not up to his taste.
I opened it several time and found some kind of foam between the LCD screen and the PCB. I cleaned bot surfaces and the foam with ethanol. For a few hours it was back working but soon showed missing lines (almost all right now).

What to you use for cleaning? Do you know where I can find a replacement foam for this?

H Steve,

I know I am loo late on that.
However I'd like to make you know that I am interested for the next run.
Having a simple but good performing general coverage receiver interests me for my in-laws farm.
My father in law is an old man and long time listener of the BBC. He was a radio-man during the war and I'd like to leave a multi-mode radio for him.
All the spare transceivers I have are too complex to use for him just turn them on and find some morse code...

Thanks for designing this new rig.

73,
Yan - XV4Y.

Topic: 11649 Message: 11649

Forgive me if this is the wrong place to ask, but I've been trying to find an instruction manual for the Tenna Dipper (original). The 4sqrp website no longer has the files available.

I looked up the Stinger singer manual, but the annunciator seems to be different between the two:

Stinger Singer: E -> L -> F -> ER -> LR -> (rpt)

Tenna Dipper: M -> K -> MR -> KR

Anyway, I figured someone here would know the details of each mode, and how do the dip switches work? I assume only one should be "on" at a time?

Thanks!
Marten

GM Marten,

It's still available http://www.4sqrp.com/TennaDipper.php near the bottom of the page.

The docmentation for all our retired kits is still on the web site. Enjoy the Dipper, it a great little project and a useful accessory.

Real radios weigh less than a pound.
I love this radio stuff !

Subject: [AT_Sprint] Tenna Dipper

| Forgive me if this is the wrong place to ask, but I've been trying to find an instruction manual for the Tenna Dipper (original). The 4sqrp website no longer has the files available.
|
| I looked up the Stinger singer manual, but the annunciator seems to be different between the two:
|
| Stinger Singer: E -> L -> F -> ER -> LR -> (rpt)
|
| Tenna Dipper: M -> K -> MR -> KR
|
| Anyway, I figured someone here would know the details of each mode, and how do the dip switches work? I assume only one should be "on" at a time?
|
| Thanks!

From: dl2arl
Topic: 11584 Message: 11652

Yippi-ai-ey am I glad to be on the list, after the short run has been widened to 100 (guess I'm #51).

I will take it with a smile and a handkiss, even if it has no iambic electronic Keyer and any memory at all. But with the MTR, what I am badly missing is the BEACON function. I know that it was hard to squeeze the code into the processor so that there were hardly 3 code words left after all was compiled. I also remember that Steve wanted to eliminate the PSK31 function because of this tightness of available memory with the second run: boy am I glad he did not. But the Beacon function is gone.

What do I need it for? When hiking, first thing I do is look for a good spot to erect the antenna. Then I set it up. If it does not work as planned, I walk further and look for another place.

Only after having set-up the antenna and the MTR running, I think of lunch, take a slice of bread out of the "rucksack" and open a bottle of beer ;-) Having the bread in one hand, the bottle in the other, there is barely any hand left to light up a cigarette or take care of the keyer (-; .

This is why I like the ATS-Series that has a beacon function. I can let the beacon call on a free frequency and I take care of the lunch meanwhile. I have a small speaker and if somebody answers, I wipe up one hand in my T-shirt and switch from the bread to the keyer.

With no beacon in my MTR, I have to press the call button every other minute or so. Not only that, but having smeary fingers from the lunch...

Just thinking loud, 73 and thanks for the great offer, I will take it anyhow, with or w/o beacon!

Okay, I guess I can add a beacon function to this rig. Was thinking it might be handy anyway. Maybe with QRSS keying speed too. Using this rig on the VLF bands has been in the back of my mind as I designed it.

I still have a few weeks in which I can continue to tweak the firmware and add features until I run out of memory. The chip is only 70.2% full at the moment....

steve.kd1jv@... writes:

Hey Gang,

With winter on the horizen, you might remember that last year about this
time I was hoping to offer a simple 160/80 meter rig, but due to technical
difficultes - basically a good idea which didn't really work - I was unable
to offer it.

The problem was the makeshift software DDS/PLL I was trying to use just
didn't cut it. That problem has been solved by the Chinese. For the
unbelievable low price of about $6.00 and $1.00 postage, you can buy direct from
China an actual AD9850 DDS board. With one of these in hand as the core, I
preceeded to reserect the 160/80 rig project.

As a bonus to using a DDS chip capable of up to 40 MHz operation, the
receiver now tunes 0 to 40 MHz! It's a direct conversion detector, so all modes
can be received. However, no preselector is included, and it seems it's
happy to hear signals which are at the 3d harmomic of the LO, but that's a
minor issue. When used on 160 or 80, the transmitter LPF solves that problem.

Anyway, here's the deal. I'm thinking of making 50 board kits available.
This design uses all through hole parts so it can eventually be marketed to
the unwashed masses. I haven't figured out a price, but I think $65 is a
good number for now, with you buying the 9850 board and a 2X16 LCD direct
from China for about another $10.00 or less. That would save me from making
that investment. The board is sized to fit into a qrpkits.com "premium"
aluminum case.

For more info, a preliminary manual (less construction details, as I
haven't gotten that far yet) is available here :

http://kd1jv.qrpradio.com/mbdc.pdf

It contains some photos of my prototype, the schematic, board layout and
operating instructions. I'm not quite done tweaking the circuit or the
firmware, but I should have that done fairly soon. At this point I don't see any
show stoppers.

For this project I'll take reservations for those who DEFINATELY want one.
Let me know Thanks!

Hi Steve,

A Holiday weekend in the UK.

Just opened my e-mail account and saw your 160/80 meter news.

Hopefully I am not too late. Definitely want one.

Subject: [AT_Sprint] New 160/80 meter transceiver design - kit

Hey Gang,

With winter on the horizen, you might remember that last year about this time I was hoping to offer a simple 160/80 meter rig, but due to technical difficultes - basically a good idea which didn't really work - I was unable to offer it.

The problem was the makeshift software DDS/PLL I was trying to use just didn't cut it. That problem has been solved by the Chinese. For the unbelievable low price of about $6.00 and $1.00 postage, you can buy direct from China an actual AD9850 DDS board. With one of these in hand as the core, I preceeded to reserect the 160/80 rig project.

As a bonus to using a DDS chip capable of up to 40 MHz operation, the receiver now tunes 0 to 40 MHz! It's a direct conversion detector, so all modes can be received. However, no preselector is included, and it seems it's happy to hear signals which are at the 3d harmomic of the LO, but that's a minor issue. When used on 160 or 80, the transmitter LPF solves that problem.

Anyway, here's the deal. I'm thinking of making 50 board kits available. This design uses all through hole parts so it can eventually be marketed to the unwashed masses. I haven't figured out a price, but I think $65 is a good number for now, with you buying the 9850 board and a 2X16 LCD direct from China for about another $10.00 or less. That would save me from making that investment. The board is sized to fit into a qrpkits.com "premium" aluminum case.

For more info, a preliminary manual (less construction details, as I haven't gotten that far yet) is available here :

http://kd1jv.qrpradio.com/mbdc.pdf

It contains some photos of my prototype, the schematic, board layout and operating instructions. I'm not quite done tweaking the circuit or the firmware, but I should have that done fairly soon. At this point I don't see any show stoppers.

For this project I'll take reservations for those who DEFINATELY want one. Let me know
Thanks!

Steve KD1JV

11675. ATS-4B frequency problems.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-26 20:03:30 UTC
From: Mike Olbrisch
Topic: 11675 Message: 11675

Steve,

Looks like the ATS-4B is out for delivery. Should be in your hands this evening. Due to a schedule change at work, my SOTA climb to Anthony's Nose has been cancelled. So there is no real hurry on the radio. Use it to test and locate this pesky little problem.

To refresh your memory:

The first time I had it happen was on 30m, and you got it fixed for me before I had to pack up for Germany. I only used it about 3 times in Germany, and it worked great. But earlier this month I was going to try it in the Spartan Sprint. 20m is the band to start with there. And somehow the display went to _ _ _ . _ _ _ . _ 47 on 20m, and had a continuous side-tone in the ear buds.

I played around with it, trying turning it on and off, flipping switches and even trying switch combinations. Somehow I got it to read 65.000.097. From there, I used DFE. From 65.000.097, then step down, then DFE to 64.000.097 again, step after step until getting it to 14.060.097 MHz. the last digits are now either .047 or .097.

You replied:

The firmware in the files section will have the latest version which would clear up the problem for now and hopefully keep it for occurring again. If you can't reflash the chip, I would be happy to do it for you for return postage.

Sounds like I should review the code. If it happened a second time, then it hasn't been fixed. The usual cause of unexplained and random problems like that is an interrupt happening at just the wrong time and some piece of data

being corrupted in the process for some reason. In theory, that should not happen.

Steve.

Thank you sir.....

At your leisure sir - we have no plans to travel overseas for 2 years. We do have some dog shows in Nov, but the FT-817 will do fine for that if the ATS-4b is not done.

The return postage label should be in the box.

Thank you very much sir.

People have been asking what DDS module and LCD to order. Here are two possible sources, there are others. The links illustrate the type of each I laid the board out to use. These are so darn cheap you might want to buy two to have a spare or to use for something else. Who knows how long they will be available for.

Yes, your on the list, along with everyone else who sent me an email saying they wanted to be on the list! A lot of you responded to the group and not to me direct, which complicates getting back to you directly. But since I'm sure everyone wants to know for sure if they should order the DDS and LCD, I suppose I do need to confirm everyone, where ever the email back might show up. And if it does show up on in the group, you probably should send me a message direct so I don't have to figure out your email address later.

Hi Gang,

Okay, my list has almost 100 names on it now, so will now cut off addtional reservations. Once the dust settles, there might be a few left over and if that is the case, maybe I'll put them on ebay and see what thier really worth, hi.

Hendricks kits is interested in taking over the project when this inital run is done, in which case it would be a complete kit with punched case and all that, so there is that option for later, especially for the mechanically challenged who don't want to hack out thier own enclosure.

In the mean time, the circuit design and board layout is about ready to be put to bed. I had to eliminate the RF preamp and kick up the audio gain to compensate. The preamp was causing too much intermod. It sounds much better now with more then enough audio to drive a small speaker. Another couple of days of testing and I should be able to call it good to go. There's probably only another 80 hours of work left before I can start kitting...

That's odd, wonder why? Maybe it's not lead free.

Any 2X16 LCD will work. The only difference is where the connections are located and the color of the back lighting. Yellow/green is common and I think easier on the eyes then the blue.

Hi, Steven:

I haven't been keeping up on details of your 160/80 rig.

Question: What parts are needed but NOT supplied?

Sorry, but I'm just "not with it."

Thier sending a couple of them to me in NH. Just got the notice that they have been shipped. The one I had finally died so I had to order a few more. I guess I hooked power up to it backwards one too many times.

You need a AD9850 DDS module from China, a 2x16 lcd display, a box, knobs and mounting hardware. For specifics, read the posts. There have only been dozens messages about this in the last few days.

Thanks. I see your message about the source of the DDS/VFO and the display, but I can't findanything about the size ofa metal box tocontain the rig. I'massuming that a well shielded box would be necessary to prevent cross modulation fromhighpower AM Broadcast stationsin the area?

Note that I may be missing a message or two. I'm suffering from being "alpha tester" of a "new and improved yahoo groups" presentation, and can't do asearch on the web of an individual contributor nor search by words as in the past.

Lettuce prey that folks who are running yahoo groups take feedback fromthe users and go back to something sensible.

Hank,

I've just been "neo-ized" myself.

First, no way Yahoo will go back. They recently did a similar change on Flickr, and there were *many* complaints there as well.

As far as the search ability goes, it's there. Kinda. I found this message by searching on "N8XX". The search box tries to be context-sensitive. If you're in a group, it searches within the group. If you're at your Groups home, it searches all the groups. I did break the search a couple times, but don't remember exactly what the circumstances were. What I haven't found is a way to search on message number. Surely it must be there, but I haven't found it.

Luckily, I primarily access the Groups through email, and use Gmail as my mail client, which allows threaded messages and lots of storage space.

I'm pretty sure this isn't a test, but a change that's being phased in. Probably within a week the changes will have been rolled out to all users. But that's a guess.

Steve,

I just went through a mixed-up process of ordering two of each of those circuits, used PayPal, and played HE#* trying to change my ID on both eBay and PayPal, still can't figure out HOWTHEBLAZES to make changes in either machine. I don't see any "help" on either outfit, to talk to a human, and get both computers reset, so I'm giving up for now, no time left. I did bypass the previous "push a button and sail through", now it's calling me a thief!

If anyone has a clue about how to straighten out BOTH of those systems, change the codes I want to change, give me a note to my private address, kindly do not get mixed up with this Yahoo crop of circuits that got struck by lighting!

There is one in the manual on page 16. Simply print the page (disable the fit to page option in page setup) and it will print to scale. If you want to get fancy, you can customize the drill diagram by using Paint or Draw or Word or Open Office, etc to add color, text or a picture.

This is what you do.

o. find the overlay diagram in the pdf file (page 16)
o. Click on the picture and save image
o. Open MS Paint from the accessories submenu
o. Paste the diagram into the window.
o. Use Paint to add color or text
o. Set page settings to Letter, landscape, scaling to 24% of original
o. print.

BTW, I still have MTR cases available, about 20 left...

From: Gil G.
Topic: 11702 Message: 11702

Hello Mr. Weber,

I like my MTR so much, I can hardly wait for the next version!
6200 miles a couple days ago with Russia on 40m. Only 10V battery output; end-fed antenna.

So, will the next MTR still fit in an Altoids box or the same size box as the last batch?
I assume a little bigger probably..

I really like the idea of a built-in touch keyer.

Thank you for your continued efforts to make the best QRP radio even better!

Gil.

Steve, group members,

I would like to make just one precision.
The display controller must be Hitachi HD44780 compatible (chinese SD44780 works great).
That's the case for most.
Some "very cheap" LCD use other controllers and are not compatible.

IC-Station (http://icstation.com) and chip_partner (on eBay) are reliable and ship to VN, so they must do the same to other "exotic" countries.
I second you recommending only the AD9850 with two pin rows, I had many problems with the others from various providers.

11708. Description of the MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-03 22:59:52 UTC
From: ab6wl
Topic: 11708 Message: 11708

Hello Everyone,

Ever since I set out a year ago to learn how transceivers work by building a NorCal40A while reading David Rutledge's "The Electronics of Radio," I have preferred to build kits such as the MTR section by section, testing each section as I complete it before moving on to the next section. Starting back in June with the latest MTR, I followed this method of referring mainly to the schematic, and I made measurements and took photos of the changing printed circuit board and the measurements that I made. One important caveat when building a radio section by section is to read through the entire assembly manual first and note any modifications or discrepancies between the parts list, the assembly instructions, and the schematic in order to ensure proper installation of the components.

I have written a description of the function of each section, and, after getting Steve's Ok, because I felt that it was important that he knew what I was doing, I have uploaded 19 pdfs to a folder labeled AB6WL. I have titled this series of documents "Toward Understanding the MTR: and other Superheterodyne Receivers and Direct Synthesis Transmitters." The word "Toward..." means that I do not yet understand everything completely, but I am working on it. Each section's description is numbered according to the order in which I built it, so that the names of the 19 files are as follows --

1_Power Supply
2_MCU & Display
3_40 MHz Reference Oscillator
4_Direct Digital Synthesizer
5_DDS Local Oscillator Lowpass Filter
6_20m Transmit Lowpass Filter
7_40m Transmit Lowpass Filter
8_20m & 40m Receive Bandpass Filters
9_Transmit Receive MUTE Switch - Part 1
10_Receive RF Mixer
11_Receiver Intermediate Frequency Crystal Filter
12_Product Detector and Beat Frequency Oscillator
13_Receiver Audio Preamplifier
14_Audio Amplifier & Automatic Gain Control
15_Transmit Receive MUTE Switch - Part 2
16_Audio Bandpass Filter
17_Transmit Drivers
18_Finals V+ Shaping & TR Switch - Part 3
19_Finals Transistors Power Amplifier

My suggestion is that you print out the schematic of the MTR on pages 22 &b 23 of the manual so that you can refer to it while reading through my explanations of the different sections. You could even print out the schematics for any of the ATSs on this website, or of the Weber Tribander or PFR-3A on Doug Hendricks' website qrpkits.com to compare the variations in Steve's designs.

Steve's MTR, with both its simplicity and its sophistication on a two-sided printed circuit board smaller than a credit card, presents a great opportunity to understand the various parts of transceivers, especially when it involves classic circuit designs that go back to the beginning of the 20th century and World War I. My hope is that others like myself who are limited in their understanding can benefit from my explanations. I have certainly benefited from trying to explain the MTR, especially the trigonometric relationships of mixer signals described in Section 12 on the Product Detector. Steve has answered questions for me along the way, and I would also welcome from the group any advice on making corrections or clarifications.

73,

Earle

Earle;

Thanks for the work in all this, now if you don't mind, could you give a "behind times on the email" OM a URL reference to where all this is located? I missed something awhile back, then got a little sicker than usual, so it would help to bring a semi-retired up to speed. I am really surprised that Steve designed his series of "pocket radios" on the same basis and parameters as the ones I learned "back in the vacuum tube era", got a lot of enjoyment out of studying the concepts of those circuits as well as some contacts I made "in the stone age".

73's, grin a lot, it helps beat the heat!

Hi Gil,

The URL for the folder is

http://groups.yahoo.com/group/AT_Sprint/files/AB6WL/

Yes, I was a little surprised to find that the inventor of the superheterodyne receiver was U.S. Army Major Edwin Armstrong in France during World War I in 1918. His is a bit of a tragic story in that he later got in a patent fight with RCA and became so despairing that he stabbed his wife, the former secretary of the president of RCA, David Sarnoff, with a fireplace poker. She left their apartment to stay with her sister, and the next day on January 31, 1954, he jumped to his death from the thirteenth floor of their apartment in New York City.

Nevertheless, his superheterodyne receiver is considered one of the most important inventions in electronic history. Starting in Section 12 and the RF Mixer, I discuss the superheterodyne nature of the MTR's receiver.

73,

Earle

Earle;

Thanks for the URL, and the historical fill-in. I read a slightly different version, in which another old "electrical experimenter" had been credited with "inventing the superhet", so Armstrong took him to court on a patent infringement. He won the initial case, then the lawyers appealed, and "due to a mistake in legal lingo", he lost, got busted down hard and big time, all his work and fortune was gone. The only note on that news was that he did himself in, no facts of what he did. That's one of the biggest problems with any popular public item, getting a patent is H***, then keeping the buzzards and vultures off your back requires some legal eagles, but those who know what they're doing will continue on. Can't be a mental case, got to have steel in your blood, and plenty of ammo ready.
I knew what the post-Korean War circuits looked like, was given some gear by friends of the family, then "rust bugs, dying tubes, and vultures" descended on me, until I just bought a Knight Kit receiver, enjoyed it for what I could get out of it. After my Air Force days, I got Novice back, then General Class, and had one devil's time trying to keep a rig on the air, antennas up, my Dad "hated radio, it didn't look like a fish", then three hucksters, not in a row, managed to "relieve me of donated gear" - went to Dallas with it, sold it for big bucks. Undaunted, I got $$ together, bought one rice burner after another, kept up all that I could do - and learned that "the ripoff guys" had their own woes, heart attacks, bad health, you name it! I presently have Icom and Kachina rigs, one ATS that Dale built for me.... yet as I had remarked, I've never seen the schematic of it.
Elecraft has a fine rig, "updated when needed", yet their approach to getting a signal on the air makes one incredibly dizzy with "What is THIS mess?", and it's hard study again. Glad I learned digital in the Air Force.

73's, look for ya on HF one day, when I have dragons slain here.

11713. MTR RIT w/strait key

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-04 06:26:58 UTC
From: <WilliamClay.Heilman@...>
Topic: 11713 Message: 11713

I am sorry if this as been addressed but I am having trouble searching the new site.

I found out tonight RIT does not work with a strait key. I also found out if I press the RIT button, the MTR transmits qgyt without spaces. This is kind of frustrating.

11714. Re: [AT_Sprint] MTR on 9V battery?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-08-25 00:42:22 UTC
From: Peter Martin
Topic: 11626 Message: 11714

I use a 3S 1000mAh lipo for both my MTR and ATS4.
http://www.hobbyking.co.uk/hobbyking/store/uh_viewitem.asp?idproduct=6470
I could get away with half that capacity as even on an all day, 3 summit trip, with 150+ QSOs there's masses of capacity left even when I stop the charge at 12v.
The 1000mA however gives me lots in reserve and weighs in at >100gms.
For the $5 investment they're worth their weight in gold!

And in action here
http://g4isj.blogspot.co.uk/2013/06/sota-fan-nedd-gwsw-007.html
and
http://g4isj.blogspot.co.uk/2013/04/new-mtr-field-trials.html

Andrew VK2ONZ

--- In AT_Sprint@yahoogroups.com, <at_sprint@yahoogroups.com> wrote:

Hello Everyone,

Ever since I set out a year ago to learn how transceivers work by building a NorCal40A while reading David Rutledge's "The Electronics of Radio," I have preferred to build kits such as the MTR section by section, testing each section as I complete it before moving on to the next section. Starting back in June with the latest MTR, I followed this method of referring mainly to the schematic, and I made measurements and took photos of the changing printed circuit board and the measurements that I made. One important caveat when building a radio section by section is to read through the entire assembly manual first and note any modifications or discrepancies between the parts list, the assembly instructions, and the schematic in order to ensure proper installation of the components.

I have written a description of the function of each section, and, after getting Steve's Ok, because I felt that it was important that he knew what I was doing, I have uploaded 19 pdfs to a folder labeled AB6WL. I have titled this series of documents "Toward Understanding the MTR: and other Superheterodyne Receivers and Direct Synthesis Transmitters." The word "Toward..." means that I do not yet understand everything completely, but I am working on it. Each section's description is numbered according to the order in which I built it, so that the names of the 19 files are as follows --

1_Power Supply
2_MCU & Display
3_40 MHz Reference Oscillator
4_Direct Digital Synthesizer
5_DDS Local Oscillator Lowpass Filter
6_20m Transmit Lowpass Filter
7_40m Transmit Lowpass Filter
8_20m & 40m Receive Bandpass Filters
9_Transmit Receive MUTE Switch - Part 1
10_Receive RF Mixer
11_Receiver Intermediate Frequency Crystal Filter
12_Product Detector and Beat Frequency Oscillator
13_Receiver Audio Preamplifier
14_Audio Amplifier & Automatic Gain Control
15_Transmit Receive MUTE Switch - Part 2
16_Audio Bandpass Filter
17_Transmit Drivers
18_Finals V+ Shaping & TR Switch - Part 3

19_Finals Transistors Power Amplifier

My suggestion is that you print out the schematic of the MTR on pages 22 &b 23 of the manual so that you can refer to it while reading through my explanations of the different sections. You could even print out the schematics for any of the ATSs on this website, or of the Weber Tribander or PFR-3A on Doug Hendricks' website qrpkits.com to compare the variations in Steve's designs.

Steve's MTR, with both its simplicity and its sophistication on a two-sided printed circuit board smaller than a credit card, presents a great opportunity to understand the various parts of transceivers, especially when it involves classic circuit designs that go back to the beginning of the 20th century and World War I. My hope is that others like myself who are limited in their understanding can benefit from my explanations. I have certainly benefited from trying to explain the MTR, especially the trigonometric relationships of mixer signals described in Section 12 on the Product Detector. Steve has answered questions for me along the way, and I would also welcome from the group any advice on making corrections or clarifications.

73,

Earle

11721. MTR: blowing up my finals

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-05 14:59:26 UTC
From: <dancbirnbaum@...>
Topic: 11721 Message: 11721

I recently built the MTR version 1, and out of the case it seemed to be working fine. I was getting about 2 watts out with a 9 volt battery. I installed it in one of MTR cases that were recently sold here and the transmitter was dead but everything else seemed to work. Replaced the 3 BS 170s and it seemed to be working great out of the case. Put it back together and then nothing. Its not completely clear in the manual where the ground wire from the antenna lug is supposed to go but I connected to the rectangular pad near the antenna wire . I have been testing it into a dummy load and measured 50 ohms at the antenna jack the last time I tried it.

Any suggestions would be appreciated before I go through the painful process of taking it all apart and replacing the finals again.

Thanks!

Dan
AD6JY

This means the rig believes it is on 20M. This is based upon a resistive voltage divider on the band module, read on power-up. Do you have the 20M module attached? Have you tried plugging in other band modules to see how the rig behaves on power up?

The "E" is telling you that there is an over current condition that needs to be addressed.If the paddle is plugged in then the power is turned on.. but with both paddles closed, for the moment that power is applied, then the paddle and radio should then act as a straight key has been plugged in, then without shutting off the power, unplug the paddles and plug in the straight key, the radio knows nodifferent, and will respond correctly with the straight key, unless there is an issue with the straight key, plug or cable.

You must plug in the straight key with power OFF, then turn it ON.

If the "E" comes on, you have an over current condition which must be fixed before the rig will work. That could be because you have damaged the PA mosfets or have some other problem.

I am an avid builder but new to this site and QRP. Where can I find and purchase an MTR 20/40 kit? I have found a manual, but without accurate board dimensions.

The MTR is currently only available on the "used" market - although you may be able to find an unbuilt kit if you're lucky. If you want to get a kit when Steve, KD1JV offers them, your best bet is to watch here in this group and be ready to buy when Steve announces availability....they usually sell out in a day or two.

11735. scrolling frequency on the single digit display on idle

Yahoo group: AT_Sprint (2012 — 2013)

From: <bubnikv@...>
Topic: 11735 Message: 11735

Hi gang,

After years, I finally found time to implement a neat feature I planned for a long time ago. Once the tuning stops, the frequency is scrolled on the single digit display automatically. The scrolling resumes after 5 seconds since the end of the previous scroll. The scrolling is processed in an idle loop, it does not interfere with reception and may be interrupted at any time by any action. If the frequency is below 100kHz, hundreds of kHz are not displayed.

See the demo on YouTube.
http://www.youtube.com/watch?v=lwg7_PbMSBc

I hope it may be an inspiration for Steve to implement into the MTR. The implementation utilizes the watchdog timer, for which we did not have any use until now. In addition, I am using the same timer to implement automatic power off, another feature I planned to implement some 4-5 years ago. The source code will be published soon.

Hi,

I'm looking for some suggestions as I troubleshoot my MTR2.

Measuring 0.5V on pin 5 and 0V on pin 6. Doesnt' matter whether the crystal is in or out of the circuit.

Also measuring about 0.1V on the pin 10 (dot). Wondering if this is off, because the clock is not operational.

Other voltages around the MCU seem as posted in Steve's manual.

This part of the circuit was initially working. After moving the QTH, I had this problem when I powered it up.

What is this telling me?

Kind Regards,

Robert, NQ0T

So, I'm new to the group and patiently waiting for new MTR kiss to become available. In the meantime, I had this idea to encase the radio in resin similar to this:
http://instructables.com/id/LED-Resin-Cubes

My main question is, would there be heat issues? Does the MTR generate much heat that it needs to dissipate? Obviously, I'd have to figure out keeping access to ports, etc, but does anyone foresee any other issues?

Thanks,
Micah (KC3AOL...soon to be either N4CA or K3WLZ)

Micah,

I think it is a bad idea. You have no way to remove the heat generated in the finals. And if they burn out you can not replace them. You also have the problem of not impeding the moving parts like the switches and plugs. If a small amount of resin prevents their action then you have just ruined the entire project.
Steve's ATS's and MTR's have shown themselves to be rugged enough for backpacking without being encapsulated. If you need waterproofing then consider placing it in a plastic baggy.

I don't understand.
Did you succeed in repairing your ATS3B?
Do you still have a problem?
What band module do you have installed when you power it up and hear the number 2?
It is normal to hear a "2" at power up if the 20 meter band module is installed.

NAQCC Sprint Wednesday night!

Our September sprint is this coming Wednesday evening local time (September 18, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Thursday September 19, 0030Z to 0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201309.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX for 1st, 2nd and 3rd place finishers (New!). A Certificate for top score in the GAIN antenna category.

Prizes: Too many to list!! - check out the prize page on our website.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6870+ members in: All 50 States - 9 VE Provinces - 94 Countries. Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

11749. MTR NR. 239 Come to Life!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-14 17:14:32 UTC
From: Lee Hiers
Topic: 11749 Message: 11749

I finally got some time to work on completing my MTR this week, and Thursday evening, I had all the parts in and the jacks wired up ready for testing. Going through Steve's check list, I did find a bad solder joint, which was quickly repaired. Otherwise, everything checked out just fine.

On to the TX smoke test...I was only getting around 750 mW out of a 9 volt battery on 40m and just under a watt on 20m. Playing with the toroids didn't do much. I figured I'd sleep on it, as it was getting late. I decided to just listen for a bit before turning in, so I hooked up my antenna, and the little rig's RX was as dead as a hammer. Dang.

I studied the schematics a good bit last night - with the confusion that seems to exist around the BPF components, I feared I'd gotten my BND-A and -B band-1 and -2 mixed up and had some kind of problem there, but finally convinced myself that that was OK. Since the odds are pretty good that a problem is due to bad soldering, I figured I'd go over all my joints - again. Late again, I figured I'd work on it over the weekend.

The second Saturday morning of each month is when the NoGAQRP group meets and I was hoping to take the MTR in for show and tell, but it wasn't to be. When I got up this morning I wasn't really in the mood to drive the 65 miles or so into Atlanta, so I got out the magnifying glass and DMM and went hunting. I quickly found a joint on one of the 612s that looked a little iffy and re-heated it...but in the schematic, that pin wasn't connected to anything, so I kept looking.

After just a few more minutes I found another iffy looking joint on one of the inductors in the LO filter. After reheating that joint and looking at the schematic, I reasoned that could be the culprit, so I hooked the rig back up to the antenna on 40m and instantly started hearing signals...the first one heard was a ZL2! Alrighty!

Swapped the dummy load back in for the antenna and started tweaking the toroids again. Now getting 5-ish watts or better for both 20 and 40 with about an 11.5 volt battery. Hook up the antenna again and start tuning 20 meters - again, I'm hearing a lot of DX, mostly UK stations in the FOC QSO party, so it's time to box 'er up!

After fitting the board in the (really nice) enclosure, I get back on 20m and make a quick QSO with K9UIY in the QSO party just to prove the rig does work and spend the rest of the morning just listening around.

Yahoo!

I still think the band switching arrangement if a little funkier than I'd like, but with only two bands to choose from, it's not bad at all. And the case is just super. This rig just feels so much more substantial than the ATS-3b and its Altoids tin...and even with the funky bandswitching, it's a lot better than switching filters in and out like on the '3b.

And don't get me wrong, I think both rigs are great! And each has its own purpose. The ATS-3b will be used almost exclusively in Spartan Sprints because it's so much lighter than the MTR. And the MTR will most likely become my main SOTA rig over the KX-3. Yes, the KX-3 is a much better radio, but the MTR is roughly 1/8 the size and weight!

I'm definitely looking forward to my next SOTA trip!

11750. Interference on 20M MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-14 23:38:35 UTC
From: Barry N1EU
Topic: 11750 Message: 11750

My MTR was finished a few weeks ago and I've used it on 4 previous SOTA outings with good results. However, while doing an activation this morning on 20M, I was experiencing strong interference/hash up and down the band at 1400Z. I was in a very rf quiet location on a mountain summit in the Adirondacks. The band was nice and quiet and suddenly the hash started (perhaps synchronous with clock turning to 1400Z). My antenna was a resonant EFHW about 30ft above the summit with clear shot/dropoff in all directions. Could that have been some kind of image/IMD/bleed-through from strong European SWBC? Anybody else ever experience this or have an educated guess?

Tnx/72, Barry N1EU

Dale;

Forgot to tell ya, been busy with "preps for going to the ranch", now waiting for the hurricane to go into Mexico and then the stream flooding to get over with.

I got the package from China, having both the adapter and the number readout for frequency, to be put on the MTR rig - or at least, I think that it's the right rig. I had to find my package again of the MTR, in fact have found several of the ATS series rigs, in need of "the patience of a saint" to put them together.

When I have my ducks in a row, and am not fretting the aftermath of a hurricane, very distant from me now, I'll start getting everything together for a big box to put them in, and wait to find out if you think I got everything together. Such a bizarre series of events, can't keep my mind on any given thing, too many things to do, I take pills by the score to keep on going with, get many things in order, then little stinky things come up that take time to do, but must be done.
I got a 100' spool of RG-8U coax, intending to make baluns of much of it, 1' "connecting isolation line, 5 turns of 6" in diameter coil, and a "feedline" of a foot... so I can put my 2 meter "J poles" up, test them out, send the whole tower and antenna up, secure the little tower properly.
Once upon a time, when I was more youthful, I could zip right up a ladder, do all kinds of roof work to make the cabin secure with tie-offs, then put the stainless steel "rope" on the antenna, tie it all off properly, and enjoy contacts on nearly anything.
These days, I'm lucky to "get into the shop without nearly falling on a pile of my junk, injuring myself". My pile of items for the ranch is getting larger, so that trip will be a super load, probably will need help in getting it unloaded, so I'll call on my "help" to get the mess out of the trailer and out of the van!

"Pray for Mexico to get the hurricane", I don't need that aggravation right now, the one road portion that I have to travel on will be underwater with some storm surge, thus I hope it's clear by the time I get there - otherwise, it's many miles to go around that one winding stretch!

73's, look for the ATS and MTR packages soon, I have yet to send Steve any money, he hasn't called for any yet.... or did I send it, and forgot?

I struggle with all mine, even the KX3 is not immune to the dreaded cellphone chattering.

On a summit I either turn the blasted thing off or else put it in my rucksack which I'll leave quite a distance away from the operating position.

It always amazes me that some folks seem to be able to browse the web and operate at the same time!
Mostly I don't have a signal anyway so it's of no value being switched on :-)

Another piece of info. The antenna was hung off a firetower and the 30ft feedline (LMR100) dropped down vertically in close proximity to the firetower. Perhaps the firetower/feedline was acting as a giant antenna for the interference?

Perhaps you're right Lee, but I don't remember seeing any wires or antennas on the tower and the hash seemed like voice xmsn going through a super narrow filter.

Colin / Barry

I think i've also experiernced some kind of mild image/IMD/bleed-through from strong European SWBC whilst on 20m but it doesn't happen very often and doesn't distract me from my operating.
I've not had any problems with Mobile (Cell) Phone breakthrough.

Am still amazed with the size and operation of this little rig ....

Barry,
Sometimes I find that my mobile phone produces a whole lot of noise in my MTR, especially when looking at SOTAwatch!
Could your phone be causing the problem? I struggle with this with a lot of my radios.

>My MTR was finished a few weeks ago and I've used it on 4 previous SOTA outings with good results. However, while doing an activation this morning on 20M, I was experiencing strong interference/hash up and down the band at 1400Z. I was in a very rf quiet location on a mountain summit in the Adirondacks. The band was nice and quiet and suddenly the hash started (perhaps synchronous with clock turning to 1400Z). My antenna was a resonant EFHW about 30ft above the summit with clear shot/dropoff in all directions. Could that have been some kind of image/IMD/bleed-through from strong European SWBC? Anybody else ever experience this or have an educated guess?

Thanks Rob - the interference was bad enough yesterday to mask stations
that were calling me.

As far as cell phone interference - what is the mechanism? I would think
maybe a phone's cpu clock could be interfering rather than cellphone RF.
But it would just be constant "birdies" rather than what sounded to me like
voice xmsn.

(for some reason, Colin's message wasn't delivered to me - noticing a lot
of issues with the new Yahoo Groups!)

I guess this is as good a time for an update as any...

I received the boards Friday and I have one almost built up for final testing. I have 98% of the parts. However, I noticed I didn't order enough 14 pins sockets or 0.01 ufd film caps, so need to get those and a few other thing I couldn't get from Mouser.

Of course, there is still lots of work left on the assembly manual and few firmware things to finish up. So, I think we're looking at at least another 2 weeks or so...

The St. Louis QRP Society is holding its annual Tailgate Sale the evening of Wednesday, September 18, 2013. 6:00 p.m until everyone goes home.

We will be at our usual location - the south east parking lot of Florissant Valley Community College - just south of the new Engineering Building.

Never a charge to sell or browse. Bring gear and money to buy more or better yet - do both! Plan to talk a lot about QRP and homebrew for starters or just visit for a spell.

Brats off the grill & sodas for the hungry and thirsty. Antennas and radios available for those wishing to get on the air or bring your own rig along.

E-mail dgauding@... for driving directions or more info.

Hope you can be with us.

Best regards,

Dave Gauding, NF0R FOR THE ST. LOUIS QRP SOCIETY

You used to be able to get free (or more lately, cheap) sample packs of filters that is a book of 100+ 1" x 2.5" or so "swatches" - look for Lee Filters or Rosco filters...I know I got several packs of the the free Rosco samplers from B&H years ago - they ended up in great demand when folks with strobes (like me) started getting the freebies to use on their small flashes. In fact, B&H is now selling a special pack just for that purpose:

11773. Is a 12m rig possible?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-18 17:32:13 UTC
From: Colin Tuckley
Topic: 11773 Message: 11773

Steve,

Summits on the Air (SOTA) have a "12m Challenge" running at the moment.

People have been bemoaning the lack of a small 12m CW capable rig, the choice for a rig for portable 12m CW seems to be between the FT817 and the KX3.

How difficult would it be to produce a rig similar to the MTR but which did, say, 12m and 10m (or 15m and 12m)? Maybe you might be interested in looking at this "12m rig challenge" after you have the 160/80 rig out the door.

I have an original ATS-3B the one where all the band module trimmers are brown but some of them have coloured stripes as follows:

80m & 40m BRN/GRN
30m BRN/RED
20m 17m & 15m Plain BRN

The build manual doesn't give values for them.

Does anyone know what values they are?

Sadly, it is not possible. The simple transmitter design which makes the ATS/MTR possible becomes very touchy above 15M. Even 15 is pushing it a little into danerous territory.

The other issue is increased current draw as the DDS chip would need to be clocked at 75 MHz. The chip I use now is rated for 50 MHz, although it probably would work okay at 75. They sell selected chips which are specified to 75 MHz for a few more dollars.

What might be possible is to use the BS170 PA as a driver to a real RF mosfet. I don't think I'd do a single board design this way as there probably isn't enough interest since 12 and 10 are effectively dead bands and getting deader and deader. I see those bands as a waste of time and money. There just doesn't seem to be life below 20M.

What I probably could do is use the 160/80 rig as a platform to test the concept. It already has the 9850 board good up to 30 MHz. The only question would be how to drive an external amplifer (like a RD16HH1 RF MOSFET) to keep the BS170's happy. Maybe a link coupling off the Drain choke.

The only problem with this set up is it wasn't designed to be real portable or current efficient. The 9850 board draws about 120 ma by it's self. OTOH, this is still a reasonably small rig and would still be lighter and more battery friendly than say a FT817.

Great, all I need is another project :)

How about a 160 - 20 rig, optimized for 5 or less out... the optional amp external boxed... or daughter board plug in...with possibly a plug in tuner optional... keep the HOT rx, and good filtering., maybe an audio filter optional for those thathave to have single signal rx. yes, bigger case, but not all that much larger... maybe about the size of the Tribander.. and a bit thicker... with batterypower, as many are now solar powered, even in the fixed location. Yes, mains are "close" but expensive too. And I rather like having my on the air time paid for with sun power.
Have a great day,

I applaud the efforts of SOTA management to encourage more 12M activity. Because of that, I've started to check out 12M whenever I've got my KX3 on a summit in the afternoon. What I've found is a quiet band with relatively loud qrp signals. I routinely work into Europe and the west coast and receive reports of 559-599. In a 4 minute stretch on Saturday, I was called by DJ5AV, N5XL, UR5NL and N6KZ. In 3 minutes yesterday, I was called by DJ5AV, DK1DVE, K6EL and IK4AVY. Similarly, I worked 3 guys on the west coast today from the Adirondacks.

12M really is an amazing band that is under-promoted. I understand that unfortunately we might never see a 12M cw rig under 1.5lb weight. But things sure could be worse ;-)

Do you evernotice that, more often than not, 10 meters "magically" opens up during a 10 meter contest such as the ARRL 10 meter contest, the 10-10 international contests,CQ WW, etc?

Activity breeds activity - one can often call CQ for many minutes, ifnot hours, on 10 meters with nary a response during a weekday, but things often change dramatically whenthere's a contest involving the band.

Actually, I think 10m is open daily, but just long distances. Recently I've worked Hawaii and Japan (Hawaii QSO Party and All Asian DX Contest) on 10m when there was nothing else on the band. One year in the minimum during the December 10m SSB contest I went out portable with a Buddipole dipole at 18ft and worked a few South American stations and one Hawaiian who was weak and too close, :).

I concur. FWIW, the 12m band has had some activity just about any day I look at it. And not just local stuff... in fact no local stuff at all. Bolivia, Panama, Guadalupe and Brazil are right on the top page of my log, along with several US and Canadian stations on 12m.

I can see where it might not be worth Steve's effort to build 12m into a radio like the ATS-3 or ATS-4. I am not certain it would be much in demand over 20m-30m-40m. But don't discount 12m along with 10m and pronounce it DEAD.

Then again, it is always nice and quiet as not many clog it up. I really like 12m when I am Pedestrian Mobile - always someone to contact, but not too crowded like 20m.

Subject: Re: [AT_Sprint] Is a 12m rig possible?

As one of the bemoaners Colin mentioned, let me be the first to attempt to dissuade everyone of the attitude that 12M is dead and a "waste of time". I applaud the efforts of SOTA management to encourage more 12M activity. Because of that, I've started to check out 12M whenever I've got my KX3 on a summit in the afternoon. What I've found is a quiet band with relatively loud qrp signals. I routinely work into Europe and the west coast and receive reports of 559-599. In a 4 minute stretch on Saturday, I was called by DJ5AV, N5XL, UR5NL and N6KZ. In 3 minutes yesterday, I was called by DJ5AV, DK1DVE, K6EL and IK4AVY. Similarly, I worked 3 guys on the west coast today from the Adirondacks.
12M really is an amazing band that is under-promoted. I understand that unfortunately we might never see a 12M cw rig under 1.5lb weight. But things sure could be worse ;-)

Thanks Steve.

A while ago I asked if you had any ATS3B band module boards spare - I'd like to build a module for 60m.

Did you find any?

11783. ATS-4a first power up: immediately shuts off

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-23 05:42:46 UTC
From: Owen B. Mehegan
Topic: 11783 Message: 11783

I just finished assembly of my ATS-4a! I was hoping against hope that when I powered it up the first time it would "just work," but unfortunately that's not the case. When I press the power button the display backlight comes on for a moment, then shuts off. With headphones connected I hear a hiss if I hold down the power button, but the backlight doesn't stay on in that case. Tomorrow I'll try the troubleshooting steps under the "Power comes on but turns right off" section in the manual. Anyone have any other tips? Thanks!

Yes Steve I fixed the Display, thank you!

Sorry for late response, I was in holiday

1. when I removed the backlight plate I saw a few cracks on the glass under the black area of the display, so I had to replace it.

Fortunately our local electronic parts distributor had this displays on stock.

2. I could even choose between severals different colours. So I took the white display with amber backlight. The white one is more reflective for outdoor use and in plain sun (SOTA use) and also amber backlight seems to have a bit more contrast as the green one.

Part number for the display is: EA DOGM132W-5 and the backlight EA LED55X31-A

so I am happy again with my ATS-4b and today- a wonderful sunny and warm autum day - I used it on a SOTA activation in the swiss alps.

OK, I reflowed the solder on Q3 and now the rig stays powered on - at least, now I hear continuous hiss in the headphones. I still see nothing on the screen, AND the backlight only stays on momentarily (not sure if that is normal).

I reflowed the leads for X6 and its connections to U9. That didn't help. Then I checked power to U9. I only see 1.45v on pin 2, instead of the specified 3.3v. I see good ground to pin 4 at least. I haven't checked L25 yet - is that where I should go next, given the low voltage to pin 2 of U9?

11794. update of the ATS-3B firmware, Vojtech's version

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-09-26 10:47:52 UTC
From: <bubnikv@...>
Topic: 11794 Message: 11794

Hi gang.

For my entertainment and to support my experiments, I added couple of features to the ATS-3b firmware. The previous version of my firmware has been successfully tested by Wulf-Gerd, DL1FAC on a stock ATS-3b, therefore I hope this version will work on a stock ATS-3b as well. Wulf-Gerd fixed two bugs in by preceding firmware version: voltage readout and VFO-B initialization.

You will find the zip archive ats3bv-1.6.zip (http://f1.grp.yahoofs.com/v1/xA5EUpXkAv4YnnqO1btigBEa4nmyOtYGahtTJndPTouBJwtm4J3KOnmJ46BlsOIVwsr3BRiYn1R2qYhLO7f89RC1eow/OK1IAK/ats3bv-1.6.zip) in the OK1IAK folder of the files section. I collected all my postings regarding the preceding versions of the firmware into the archive, including the WSPR beacon code generator.

First, there is a receive-only mode, which allows selection of a receive band by tune up / down buttons on power on. The mode is useful for experimenting with receiving only antennas like a small tuned magnetic loop antenna. I built a simple band module on a perf board with a band resistor value between 80m (open) and 40m. There is no band filter on this simple band module. I also modded by ATS-3b receiver by adding a transistor before the IF filter to improve SNR of the receiver. The idea was borrowed from Elecraft K1 and KX1 receivers. The modified receiver has enough sensitivity, that a 40cm diameter loop made of 6mm aluminium tube provides around 10dB more band noise over the receiver noise indoors. It was an eye opener to me regarding the efficiency of an indoor antenna.

Then there is an automatic power off feature, switching the radio off after 15 minutes of inactivity. Working only with my modified hardware.

At the end, the most interesting feature I believe. I added an automatic readout of frequency and battery voltage by scrolling on a single digit display. The frequency and battery voltage scrolls once every 10 seconds automatically. The scrolling may be interrupted at any time with any button or paddle. Hundreds of kHz are not shown, if zero. Tenths of volts are not shown, if zero. Every digit lights for half a second. The decimal point is lit with the 1s of kHz digit and with 1s of volts digit.

During tuning, the 1s of kHz digit is continuously displayed. Once tuning stops, the display dimms for half a second and then the complete frequency scrolls, without being followed by the battery voltage. This way the battery voltage does not disturb the tuning process. After 5 seconds of idle, the frequency will scroll, this time followed by the battery voltage readout.

The battery voltage readout is extremely important for those using lithium ion chemistry accumulators (LiIon, LiPol or LiFePO4). If those accumulators are dischared below certain voltage per cell, they are destroyed. It seems natural to trigger battery readout manually time to time, but it happened to me couple of times, that I was surprised with an unusual behavior of my ATS-3b radio and then found out, that the voltage reading of the battery pack dropped deep below 5V. Interestingly, my LiFePO4 cells survived these deep discharges to some extent, but I would not recommend it.

Bob,

A reasonable minimum voltage, at which the radio shall work reliably, is around 5.5V. If ran at lower voltage, the voltage regulators do not regulate anymore.

At least some progress ;) As a matter of fact I had initial problems with my display as well. The reason was that I had followed the manual saying that "To make removal of the display easier, it helps to first plug something else in and out of the IC socket several times, like a dip IC to take some of the tension out of the socket leafs". I did this too thoroughly and ended up with the same problem as you describe. After exercising the socket the opposite way I managed to cope with this.

Good luck!

Given the low voltage at pin 2 of U9, I suspect there is more wrong than just a problem with the display. I did not attempt to loosen up the socket before inserting it (didn't have any DIP ICs on hand). Is there anything I can do with the function buttons that might let me know if everything else was working? Can I get the rig to announce the frequency over the headphones, for example? I don't see anything about that in the manual.

Hello,

I've run mine down to 6V, and of course it worked just fine.. I got three 1050mAh Lipo battery packs for it and can't find a straight answer as to how low they can be discharged without damage. I've read 2.5 to 3.7V. It seems to depend on voltage under load. The MTR draws what, 700mA on TX? That's much less than say, a RC helicopter! So, any advise as to the minimum total voltage for my 3S packs with the MTR? 9V?

It is nice to know that I could drain the battery to destruction with the MTR if I really needed it!

Thanks,

Gil.

Hi Gil. My name is Scotty. About 6 months ago I got some 3S lipos to use on my HB1B for backyard use. Everything I've read online and in the instruction manual for charging the batteries says a full charge is 4.2V per cell which will give you a start voltage of around 12.6V. Like you I was unsure how low I could go while discharging . The manual says no lower than 3 volts per cell or it shortens the lifetime of recharges you could possibly get. That would take you down to 9 volts before stopping to either recharge or just swap out for a new charged up battery. While reading from many sources on the internet, to be on the safe side I see many people only go to 3.3 V per cell or total 9V for a stopping point. That's what I do. The TEN TEC flyer on the HB1B says 9 to 14 volts. It draws about 800ma on send. The radio has a voltage readout so I can tell at a glance what the total volts left are at any time. Lipo's last the longest using a balanced charge setup. Hobby KIng makes a small voltage monitor that plugs into your balance lead and it tells you with red and green lights when you are reaching the 3.3 volt per cell limit. I think it costs about $ 2.50. When any one of the cells drops below the 3.3 limit this device lets out a horrendous screech. Guys running motorized Gliders Can here this and know it's time to land or your battery will soon be Kaput! So I guess it's up to you. I use my HB1B for 2 hour sprints using an 850ma 3S lipo. I have yet to hit the 9 volt limit. I call CQ alot so these suckers last a long time. You are perfectly safe at the 9.9 volts but you could safely to to 9V or 3.3V per cell. Just be sure you are balance charging to get the most life out of your battery. Anyway , I hope this helped to answer your question. All the Best de Scotty KG3W

3.7V. It seems to depend on voltage under load. The MTR draws what,
700mA on TX? That's much less than say, a RC helicopter! So, any advise
as to the minimum total voltage for my 3S packs with the MTR? 9V?

It is nice to know that I could drain the battery to destruction with
the MTR if I really needed it!

Thanks,

Gil.

Sorry Gil, I just proof read my entry DUH!! 3.3 +3.3+3.3 = 9.9 volts . NOT 9. I stop using my batteries around 10 or 9.9 volts. total. You could got to 9 volts, but I chose to stop at 9.9. Sorry about the confusion. de Scotty KG3W

---In AT_Sprint@yahoogroups.com, <at_sprint@yahoogroups.com> wrote:

Hi Gil. My name is Scotty. About 6 months ago I got some 3S lipos to use on my HB1B for backyard use. Everything I've read online and in the instruction manual for charging the batteries says a full charge is 4.2V per cell which will give you a start voltage of around 12.6V. Like you I was unsure how low I could go while discharging . The manual says no lower than 3 volts per cell or it shortens the lifetime of recharges you could possibly get. That would take you down to 9 volts before stopping to either recharge or just swap out for a new charged up battery. While reading from many sources on the internet, to be on the safe side I see many people only go to 3.3 V per cell or total 9V for a stopping point. That's what I do. The TEN TEC flyer on the HB1B says 9 to 14 volts. It draws about 800ma on send. The radio has a voltage readout so I can tell at a glance what the total volts left are at any time. Lipo's last the longest using a balanced charge setup. Hobby KIng makes a small voltage monitor that plugs into your balance lead and it tells you with red and green lights when you are reaching the 3.3 volt per cell limit. I think it costs about $ 2.50. When any one of the cells drops below the 3.3 limit this device lets out a horrendous screech. Guys running motorized Gliders Can here this and know it's time to land or your battery will soon be Kaput! So I guess it's up to you. I use my HB1B for 2 hour sprints using an 850ma 3S lipo. I have yet to hit the 9 volt limit. I call CQ alot so these suckers last a long time. You are perfectly safe at the 9.9 volts but you could safely to to 9V or 3.3V per cell. Just be sure you are balance charging to get the most life out of your battery. Anyway , I hope this helped to answer your question. All the Best de Scotty KG3W

After further examination, I discovered that I mounted U10, the 60 MHz oscillator, rotated 90 degrees from where it should be. I've been trying to desolder it, but I'm having no luck so far despite the use of braid and flux. I've gotten most of the solder off, but it always seems like that last bit is nearly impossible to remove. Anyone have any tips for this?

And it occurs to me to wonder whether I can check if I've damaged the crystal before I put it back in the right orientation. I'd hate to have to desolder it AGAIN. Suggestions?

Not likely to have damaged it.. they take a lot. Can you put the radio on a hot plate, let it heat... or cup warmer... let it heat for a while.. then touch the corners with an iron... and lift the clock off the board... THEN SHUT off the cup warmer... let it cool down... BEFORE trying to reset the clock in place. You don't want to move it while the solder is very nearly flowing on the board. Once you have the clock back in place... and correctly oriented.. test it. Should be fine.(voice of experience... had one that had no orientation marks, but it worked... sure.. I had a 50-50 shot of getting it right... the first time...but I had a 100percent chance the second)

Have a great day,

Hi Owen,

My suggestion is to use ChipQuick and isopropyl alchohol. The product is very easy to use and causes minimal stress to the item you are removing. There are a number of YouTube videos available that describe how it works. You can go to the ChipQuick website, Amazon, Ebay, Digi-Key, Mouser and lots of other places to purchase it. http://www.chipquik.com/

Chipquik works remarkably well for small pitch high pin count SMTs. I reflow the solder/chipquik with a soldering iron @375F and it works well. The only downside is that it's a little spendy. Well worth it to me to not have to repair a lifted trace.

Try the little kit ($16?) with the liquid flux and see what you think.

I use Chip Quik usually, but also have used this method.

I take a single strand of Stainless Steel wire from a piece of bicycle brake cable, probably around 26 gauge.
SS wire doesn't stick to solder. I slide the wire under the chip edge where the pins are on one side, then bring the wire around and grab both ends with pliers. Using a fine tip iron, I heat each pin while slowly holding tension on the wire and pulling gently. As each pin unsolders, the wire slips out pushing the pin up, breaking the solder bond. When one side is done, I do the other. The chip is reusable if you carefully push the pins back down.
It's worked well for me many times and leaves the lands intact (almost always!).

That works with the IC's but not with the clock osc, as you can't get a wire under it.

For the clock osc the best way is two soldering irons to heat both pads on one side of the package, while grabbing it with pliers and putting some gentle torque to the package. Get one side to lift a little off the board, then do the same to the other side. Don't worry about getting it too hot, you can't seem to damage them regradless.

Typically I just work one iron back and forth between the two pads on one side of the package until it starts to lift. The main problem is there isn't much for the pliers to grab onto.

11816. NAQCC Sprint Tuesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-02 18:28:52 UTC
From: NAQCC
Topic: 2905 Message: 11816

NAQCC Sprint Tuesday night!

Our October Sprint is this coming Tuesday evening local time (October 8, EDT - 8:30-10:30PM, CDT - 7:30-9:30PM, MDT - 6:30-8:30PM, PDT - 5:30-7:30PM), which translates as Wednesday October 9, 2013 0030-0230Z in all cases.

NOTE: For this, our Ninth Anniversary sprint, we are repeating what we did for our 100th sprint in February. This time we have NINE extra special prizes which will be awarded to nine different participants in a random drawing. The drawing, as in February, will take place in a 'semi-live' web cast. That will be on Columbus Day, October 14 around 2300Z. The web cast can be accessed here (http://naqcc.info/prize_drawing_9th_anniv.html). Details of the prizes are being kept a secret until the web cast.

I will refer you to the proper URL:

http://naqcc.info/sprint201310.html

There you will find all the details as to time, frequencies and other important information.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you've been hesitant to join in our sprints because you hear other sprints running at breakneck speeds, have no fear. Our sprints are geared to the newcomer to CW and/or contesting. Virtually everyone including the many veteran contesters who regularly enter our sprints will slow down to YOUR speed to help you make your contacts.

The NAQCC Ninth Anniversary runs from 0000Z October 6 through 2400Z October 12, a full seven days as usual. We now have 40 operators to man our 10 calls (N1A through N0A). Special QSL cards and certificates are available for working the anniversary special event stations. A N#A spotter page will be available at (http://naqcc.info/spot_schedule.php) to see where and when the N#A stations will be operating. Full information about the NAQCC 9th anniversary celebration can be found at: http://naqcc.info/main_n3a.html

If you are not already a member of NAQCC... membership is FREE! Sign up on the NAQCC website today (http://naqcc.info/) and receive a handsome certificate, with your membership number on it, which is good for life.

Come join us and have a real good time!

72/73 de Dave VA3RJ

From: Owen B. Mehegan
Topic: 11818 Message: 11818

I thought I would start a new thread, since I have made progress since my initial posts about not getting the rig to stay turned on. I fixed that but still got nothing on the screen. Backlight comes on and I hear hiss in the headphones, but that's it. I don't think the issue is just with the LCD itself, because I can't get the rig to turn off by holding down the FN button.

Last week I discovered that the 60 MHz oscillator was mounted wrong, rotated 90 degrees from where it belonged. I figured this out after leaving the rig plugged in for a few minutes while checking voltages at various points, and realizing that U10 (the crystal) and U9 (the MPU) were pretty hot. Thanks to everyone's tips about Chip Quik, tonight I managed to re-orient the crystal. Now when I power up the rig I see 3.3v on pin 2 of U9, and also on a few pins of the LCD for what it's worth. The connections for X6, the 32.768khz crystal, back to U9 are good. I'm a little stumped for what to look at now.

My other early problem turned out to be an old battery with too little voltage to drive the rig. When I first swapped it for a new one, I heard a staccato buzz in the headphones when the rig was powered on. I suspect this was related to U10 being installed wrong. But after being powered for awhile, getting hot, etc., that noise went away. This was before I corrected U10's placement. So I do wonder if something got fried.

I'd appreciate any further suggestions!

Hi Owen, A very close look at U7 and U9 pins, the connections to the display, and the row of caps and resistors just above U7... may revealsomething. You're getting close, and congrats on finding the reversed osc too.

Have a great day,

Subject: [AT_Sprint] ATS-4a new build - screen is blank

I thought I would start a new thread, since I have made progress since my initial posts about not getting the rig to stay turned on. I fixed that but still got nothing on the screen. Backlight comes on and I hear hiss in the headphones, but that's it. I don't think the issue is just with the LCD itself, because I can't get the rig to turn off by holding down the FN button.

Last week I discovered that the 60 MHz oscillator was mounted wrong, rotated 90 degrees from where it belonged. I figured this out after leaving the rig plugged in for a few minutes while checking voltages at various points, and realizing that U10 (the crystal) and U9 (the MPU) were pretty hot. Thanks to everyone's tips about Chip Quik, tonight I managed to re-orient the crystal. Now when I power up the rig I see 3.3v on pin 2 of U9, and also on a few pins of the LCD for what it's worth. The connections for X6, the 32.768khz crystal, back to U9 are good. I'm a little stumped for what to look at now.
My other early problem turned out to be an old battery with too little voltage to drive the rig. When I first swapped it for a new one, I heard a staccato buzz in the headphones when the rig was powered on. I suspect this was related to U10 being installed wrong. But after being powered for awhile, getting hot, etc., that noise went away. This was before I corrected U10's placement. So I do wonder if something got fried.
I'd appreciate any further suggestions!

Hopefully we will have the new 160/80 kits on the air soon. Until then what antenna is everyone using or planning to use for 160m?

I am putting together a top loaded "no excuses" vertical following K6MM's design. More info is here: http://www.k6mm.com/pages/ant-v160.html

I plan to use my existing 6BTV radial system with this antenna. We will have to plan some type of 160 sprintthis winter.

Paul,
I will be using either a Butternut vertical or a 135 Foot OCF dipole on 80. The 160 antenna will be a quarter wave sloper wire (actually 112 feet after trimming) fed from the top of my 40 foot tower. All three of these antennas work very well for QRP DX.
73,
Dave K1THP

11824. Re: [AT_Sprint] 160 antennas

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-04 03:29:55 UTC
From: Hank Greeb
Topic: 11821 Message: 11824

I plod along with my venerable Drake TR-5, Heathkit HM-9 wattmeter/SWR Bridge, LDG Z-100 tuner, and an inverted "V" cloud warmer to which I add "antlers' at the end as capacity hats so I can tune the SWR to 50 ohms with the Z-100. I MAY, built a vertical with some radials, but probably won't get a "round tuit" because 160 isn't one of my favorite bands.

I'm not so sure a linearly loaded wire vertical on 25' chunk of fiberglass pipe could be considered "no excuses" - but I'm sure it will be better than a dummy load buried 6' under ground. Perhaps a better vertical would be as high of a support as one thinks he/she can put together - like a 31' jackite pole on top of 3, 4, or more (4 foot) sections of military surplus fiberglass antenna supports, to make a vertical of 40 to 50 feet tall, with linear loading around the mil-surplus part of the system.

Actually, anything in the clear, as high as practical, should do reasonably well.

I'll "probably" get on the ARRL 160 (2200Z, Dec 6 to 1600Z, Dec 8) and the CQ 160 (2200Z, Jan 24 to 2159Z, Jan 26) contests, just for the fish (halibut). Last few years I've been with a multi op effort at a "super station" (1.5 KW out, quarter wave vertical - full size for transmit antenna, and a series of 1000' beverage antennae for receiving) but the owner of the station says his work sked is getting crazy and he can't host such operations.

As for sprints, keep an eye out for the Northern California Contest Club Sprints. I haven't checked, but they typically change to fit the upcoming weekend contest. And, if memory serveth correctly, and early onset of Alzheimer's doesn't catch up with me, NAQCC runs a 160 meter test, in 2013 it was Thu Jan 24 8:30-10:30P EST or Jan 25 0130-0330Z. That means that they "probably" will have a similar 160 meter event on January 23 (local time) 2014. It seems to me to be best NOT to have a specialized "one-off" contest for the KD1JV 80/160 rig, but dig in to the melee of a "real" contest.

That's my 0.5 cents worth.

11827. Some track record!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-04 15:57:27 UTC
From: Håkan Olsson
Topic: 11827 Message: 11827

Just to show to you all that the ATS-4b is a very nice and reliable rig I just want to mention the following track record...

I have been active in the Swedish SMFF program during this and last year. I have always travelled by bike, as I do not have car, although for my longer trips down south of Sweden me and my bike have gone by train. During this time I have activated 306 different SMFF-areas. Some of them more than once making it next to 400 times I have been sitting in the bush transmitting with my little rig. Some times in very nice and warm weather, some times wet and cold and some times in poring rain. My trusty ATS-4b have never failed me once!

In total I have made some 7500 qso:s. All on 40 and 80 meters. The antenna has been an End Fed Half-Wave Dipole for 40 meter with an added 40-meter trap and an additional 11 meters of wire to make it work on 80 meters. All this has been supported at 12 meters with a 15 meter glas fiber pole that I bought from DX-Wire in Germany. To the antenna I have added a Hendricks SLT+ tuner. With this setup I have been able to work most of Sweden up to Abisko in the very north and down through Poland, Netherlands, France, Britain and Germany.

I say this only to show that if you put it together correctly this little rig will serve you with distinction for many years, through wet and cold and without any problems!

I can only add that I would hope that Steve will release another batch of this rig. You see, on this side of the Big Pond 80, 40 and 30 meters are the band of choise both for SMFF, WFF and SOTA operations. It may not be on the western side of the Big Pond, but on this side it is!

N8XX

Ahhh, SMFF is a very nice thing! The purpose is to work radio from National Parks, Nature Reserves and Nature Preservation Areas and so called "Natura 2000" areas. In Sweden there are many. Almost 6000 I think. The thing is that you get out in the clean fresh air and come to visit places you would not have visited otherwise. In short; a wonderful way to learn to know your country. Basically it is a competition. You could collect activated areas, worked areas or just points. If you are good you will get a diploma, recognition and eternal glory!

How you want to view it; as a good pretence to work radio or a good pretence to get out in nature and get some fresh air, is up to you! :-)

You can read about it here: http://smff.sk6aw.net/

WFF is the same thing but on the European scale. The rules are a bit stricter, but basically the same.

You can read about it here: http://www.wff44.org/

Still no luck. Here's what I tried last night:

I reflowed the solder on the resistors and capacitors above U7.
I checked connections from U9 to the display pins. Looks like this should be pins 18-15. I see 3.3v on 18, 16, 15, nothing on 17. But I see continuity from pin 17 to the display.
I was less sure of what to look at on U7. I have 1.7v on pin 3 and 3.3v on pin 4 and 5. I have 3.3v on pin 14 and 15, but nothing on pin 13. Which makes sense, it corresponds to pin 17 on U9.

Thoughts?

Håkan,
that is very impressive and just shows what a great rig the ATS4 is.

I've notched up approx 2500 QSOs mainly operating SOTA.
I don't use 80 metres and have had lots of contacts on the higher bands, 17 and 15 metres including several summit to summit contacts.

I know if Steve did another run of these rigs they would sell like hot cakes!

Thanks for the link to your blog, it's nice to see another ATS4 out in the field and on a bike.

I also do some bike operations when I'm not hiking with the rig.

My blog is at http://g4isj.blogspot.co.uk/
I'm trying to catch up with the words to go with the photos :-)

Too much to do so little time!

I really can't expand any farther on troubleshooting that what is already written in the manual. As I keep repeating, it's all in the soldering. You need to idenitfy where the bad connections are since using the "shotgun" method of resoldering everything often causes more problems then it solves. Too much of that and you can damage the plating on the ends of chip resistors and caps or even cause a cap to crack.

The other issue is the more you fiddle with it, the greater the chances of breaking something else. Although it is disapointing not to be able to get it to work, sending it to me does save us both a lot of time and effort running around in circles and not getting anywhere.

I have found that sometimes I get a "warp" in the board the screen is mounted on,and a slight adjustment of the screws holding it to the case will bring the illumination back on.Sometimes I guess it just shorts out a bit and relieving the tension helps to turn things back on.

I am now accepting payment for the MBDC 160/80M board kit, which will start to ship as soon as Monday. Unfortunetly, many of you responded to the list and not to me directly, so I can't notify you directly. I supose I could spend a few hours tracking down everyones email address, but I'd rather not.

So, if you indicated you wanted one of these kits and have not yet received an email from me, check to see if your call is on this list. Then send me an email direct (steve.kd1jv@gmail.com mailto:steve.kd1jv@gmail.com) to confirm you still want one and to get the final price and order info.

DX orders: I haven't gotten to you yet. DX orders take extra time and effort (and I haven't check the shipping costs yet) so I'll get to you when my domestic orders are done.

Anyone late to the party will have to wait until I find out if there are any left..there is a good possibility there will be a few...

Thanks, Steve

Hello Steve

I'm a DX order but I wanted to let you know that I shall be away from home from the 17th to 31st October and although my wife will still be here, she won't be picking up my mails, let alone buying radios for me!

However, if you also send your notification message to my @gmail address (see above) as well as my regular address, there's a good chance that I will be able to pick it up and get my payment to you - if that fails, please hang on to my kit until after 10/31 as I definitely want it and I won't let you down.

Thanks a lot for coping with problem people like me...

73

Hi Steve,

Well, I think that's due to the "Neo" interface of Yahoo, but I dont' see which list you're talking about.
Also, I would like to write to you directly but your address is hidden and when hitting the "Reply" button on the website I cannot select the sender's address...

To make it short :
- YES I would like one MDBC kit
- I know I am DX and I will pay when you told me to do so
- I will send you by e-mail a letter to join to the package for the vietnamese customs

Thanks.
73,
Yan - XV4Y.

Hey Steve and the group;

Sadly, although I emailed you directly on August 28th and then again on Sept. 24th (and once again yesterday afternoon) to confirm my wanting to complete the purchase....you apparently did not get any of these emails as I did not hear back from you and I am on the list below.

Alas I am trying a fourth time in the same email to the group AND directly to you. IF you only get this email via the group there seems to be some email-snafu beyond my control.

In any event: PLEASE email me directly at w9ya@... to confirm so I can pay you !!

TIA es vy 72 om de;

- Bob, w9ya

Hi, Steve,

I sent a check in today's mail, which I promised in a message yesterday. It should arrive within the month, or less, given or take.

This message is going direct to you, and to the reflector. I'm not on the list below, but I'm sure you received my earlier message since it didn't bounce.

I'm VERY happy that you're doing such a service to the Low Power Ops.

11849. Parts?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-12 04:16:37 UTC
From: <n8xx@...>
Topic: 11849 Message: 11849

I'm a dunce when it comes to getting parts. I read in the manual for the 160/80 meter rig that we need an AD9850 DDS module and a 2 x 16 display module. There was some chatter about the best place to purchase the AD9850, but I lost the info in my mailer, and it's impossible to search the "neo" form of the yahoo group.

Does anyone have a cache of these items who would be willing to part with one each for a nominal price? I vaguely remember that there were several kinds of 2 x 16 display modules, and some were preferable to others.

Steve says the box he specified is a bit skimpy. Has anyone come up with a slightly larger commercial box?

I'm probably behind the eight ball, and will have the kit from Steve before I get around to purchasing the extras. Oh, well, I've been meaning to join the Procrastinators of America for over a year now, but haven't even downloaded the application blank from their web site.

Advice please. Tell this neophyte where to go to find these items. Tnx es

Thanks Earle!

I'll try the local guys first - I've never been to their emporium, but a fellow ham saysthey have most everything imaginable. And, the local Chamber of Commerce wasplugging "buy local" recently - so, if parts are actuallyavailable locally, and theprice ok, I guess I'll buy them here in town.

Iwilllookcarefully at the specs forthe display - I remember some possiblity of getting parts with a different pinout.

This isbeginning to sound like fun!

As far as I know, you can only get the DDS module from China. If you buy it from someone else, your just paying for them to import it and mark it up.

Any 2 X 16 LCD module will work, but one would have to watch the pin out since ones with the pins other than along the top will likely have the pins in the opposite order and the connecting cable will need a twist in it. But for about $4.00 I doubt you can beat the China deal.

It takes 10 to 14 days for the parts to arrive from China, but your only paying $1 for postage!

Steve

From: Hank Greeb
Topic: 11837 Message: 11853

I'm wondering why the differential in price for the AD9850 from Mouser at $23 for a 584-AD9850BRSZ vs $5 or so from China, including free shipping. There are several other versions listed at Mouser, one for as low as $16, but one must order over a 1000 units to get this price.

Is the import duty for multiple units that great? Or, is it that the AD9850 isn't in wide use in the U.S. so it doesn't really pay for the parts suppliers to keep a stock on hand. Or are the Chinese units off-spec?

QRP >99.44% of the time

p.s. Maybe, just maybe I can have the rig ready for the ARRL 160 contest, it Starts 2200 UTC Friday December 6, ends 1600 UTC Sunday December 8, 2013. Now THAT would be a real blast! Last year I was with a multi-single operation which had a 135' full quarter wave antenna, several beverage receiving antennae, and 1.5 KW rig. Until we had worked most all the stations we could hear, contacts were like shooting stationary targets, and most of them came to us!

Or, the fact that my messaging software cra$hed about a month ago, but I can't find details of how one programmes the AD9850 computer inside the new 160/80 meter transceiver.

I'm sure these data exist, because Steve said he has at least one prototype going. It's probably hidden somewhere in the "rescue" file which contains most of my inbox prior to the cra$h, but I haven't figured out the search terms to use.

Steve (or someone else) will you "please tell me where to go" for the computer program to run the AD9850 in the 160/80 rig?

I'm sure there are many people who would like to tell me where to go. :)

there is no computer program required. The rig contains a microcontroller chip (Mega48) that controls the DDS. (The same as all the KD1JV ATS series rigs).

> why the differential in price for the AD9850 from Mouser at $23 for a 584-AD9850BRSZ vs $5 or so from China

Profit! ???
In my experience buying LED flashlights and MR16 bulbs shipped from China, there can be quality issues from some manufacturers, others are good, and a low price does not necessarily mean it is a bad product.. Find a site such as dealextreme with lots of user reviews posted on products from many different manufacturers to get a feel for what kind of trouble to expect. I'm wearing prescription eyeglasses bought the same way from HK, good quality at a fraction of the cost extorted by the US conglomerates.

---In at_sprint@yahoogroups.com, <n8xx@...> wrote:

I'm wondering why the differential in price for the AD9850 from Mouser at $23 for a 584-AD9850BRSZ vs $5 or so from China, including free shipping. There are several other versions listed at Mouser, one for as low as $16, but one must order over a 1000 units to get this price.

Is the import duty for multiple units that great? Or, is it that the AD9850 isn't in wide use in the U.S. so it doesn't really pay for the parts suppliers to keep a stock on hand. Or are the Chinese units off-spec?

The story I heard was that a ton of these were built with incorrect filter values for their original design and so are being dumped as a result. They work fine for the frequencies we use them.

Well, that's a good question, especially since the 9850 from China is a complete module, already assembled on a board with all the associated SMT parts needed to make it work (clock osc and output filter) and header pins, while the 9850 from Digi-Key is just the chip.

The best guess I have is that someone made a sh!t load of these and then didn't need them, so they became surplus. Maybe their salvaged out of something. Who knows, but if you can buy something which should retail for 50-60 bucks for 5 with free shipping, it would be foolish not to.

Steve KD1JV

After examining the two Chinese modules I purchased, and comparing the AD9850 DDS chips to known authentic AD parts here- I am fairly certain these may be Chinese counterfeits of the AD DDS chips. The lettering is significantly different than the "real ones" I have here. As long as they work in this application- OK. If one fails, I'll replace it with a real Analog Devices spare.

I think it is very likely that the 9850 DDS chips on these are Chinese counterfeits. I have compared the lettering on the ICs to several known "real" 9850s here. They are different enough to lead me to believe this may be the case. As long as they work at the lower frequencies we are trying for, we're OK. If one fails, I've got authentic spares I can replace them with.

Bruce, Steve;

This makes my back and arms ache, I got two separate packages back from two different sources, one had the readout(s0 in it, the other is the mounting module. I think that, since I'm aiming at sending the whole package off to an experienced expert to do the assembly, I'll wait for him to tell me "Yea" or "Nay", my time for this fall and winter is going to be used up with work on and repairs to two separate places that have to have extensive and difficult work done.
Isn't it time for someone group in the Asian area to get an idea going about overall standards, something like our SAE group here? That might reduce the outright theft and confusion of the end user.
Resolving this item may well take time away from putting a rig on the air!

Well folks, looks like I have a couple sets of the controller and display that I won't be able to use. My request to Steve on August 24 to be on the list was apparently lost. So, if any of you lucky ones are in need of those chips, please let me know and we can work it out, they were low cost, came from China, what Steve reccomended.

Thanks,
Bill - W7WEL

What's the deal? Let me know and I'll send a check tomorrow. You can keep the chips until a week after you cash the check just to make sure the rubber on which I write checks doesn't bounce too hard. I don't like Paypal, but if you insist, I can do that too.

I'd probably like the two sets, because, as one fellow said, I don't want to let the smoke out of one and find I'm behind the 8 ball.

Before sending it to Steve, I got an electrical engineer/ham friend with good test equipment to look at the rig with me. I was surprised to find that the 32 khz crystal for U9 wasn't working. In spite of Steve saying in the manual that this could be a problem, it seemed very unlikely to me that a part like that would be DOA. But sure enough we replaced it and the rig booted up normally! Receiver seems to work, I was able to hear CW on 40m. If I'd had my own oscilloscope I would have figured this out much sooner. I'll finish peaking the receive filters soon and put it through its paces. Looking forward to finally getting on the air with it!

11884. ATS-4a - sometimes won't boot, sometimes won't turn off

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-16 02:13:21 UTC
From: Owen B. Mehegan
Topic: 11884 Message: 11884

So, as I mentioned yesterday, after replacing the dead 32 khz crystal that came with my ATS-4a kit with one from a junk box, I got it to boot up. Since then, though, I'm seeing that it doesn't boot up reliably. One minute it does, the next minute it doesn't. The solder joints are fine, so I'm guessing part of the problem is that I should use a crystal that's identical in spec (not just frequency) to the original one.

Another thing I'm noticing is that when the rig DOES boot, I can't turn it off completely. If I hold down FN, I see "OFF" on the display after a few seconds, but releasing the button does nothing further. The rig seems to be in a locked state and I have to pull the battery to shut it off. What would cause that?

Actually, the TP/TPB/TPC-45 Ten-Tec case looks like it would be best. And for just under $9.00, what a deal.

http://www.tentec.com/categories/Enclosures/T-Series-Enclosures/
http://www.tentec.com/categories/Enclosures/T-Series-Enclosures/ you have to click on the picture to get more info, the text link is broken.

The minium size for a case is 5" x 5" x 2.25"

The -45 case is 6.4" wide, 5.2" deep and 2.6" high.

The little extra higth of the case compared to the Hendricks case allows for moving the display a little higher and giving more clearance to the volume control and PB switch extention shafts.

The wider front panel would let you move the tuning encoder over a bit more, giving better access to the PB switches and or allowing for a bigger knob.

The crystal shouldn't matter, thier all about the same execpt maybe for size. You'd best take a real close look at the solder connections to the pins the crystal connects to at the processor.

As for it not turning off, that is a real simple circuit. Something is keeping the pass fet turned on and there are only a couple of things which can do that. A short across the On switch (the cap or mosfet) or a short at the processor keeping the pin which goes to the gate of Q3 high.

I'm wondering if it would cause any problems to use off-board panel mounted toggle switches for S2,S3 and S4? A front panel mounted DPDT seems like a good alternative to the 2 slide switches for the filter switches. Seems like it would be more convenient and provide more options for cases.

You could do that for the Rx input switch, but I'd be concerned about using a DPDT for the transmitter filter.

There could be two possible problems.

1) the extra lead length to the switch might cause stability problems with the PA. Although this might not be a problem given the relatively low frequency of this rig's transmitter.

2) This is the more important one, there would be less isolation between the input and output of the filter, due to coupling between the wires running to the switch and at the switch it's self.

Oh, and there is one other problem, you'd need a second switch to tell the processor which band is selected. So, concern #2 would be lessend when using two switches, one for input and one for output as it is now. Although you could use a 3PDT toggle. Thier not as common, but they can be found, pricey though.

But there would be space penality having to use two DPDT toggle switches. In order to keep the lead length to the switches as short and as direct as possible, they should be mounted in line with the existing switches on the front panel and a low as possible. The connections should be routed under the board in an effort to minimize any coupling to other parts of the circuit.

Finally, if you use "minature" toggle switches, there won't be enough clearance between the board and front panel without getting longer shaft extenders for the PB switches. Which means you'd end up putting the switches on the back panel, which is almost as bad as having to lift the case up to operate the slide switches from the bottom, so you don't gain much in terms of ease of use.

Another possibility would be to package the MBDC similar to the ATS-4, with the display on top. Just make some extensions for the handles on the existing switches to reach the cover. Use a fairly low height case.

Although this is not the maiden voyage of my MTR it is the first time I used it in the Altoids tin. I have not decided on the labeling of everything yet so it is just white for now. I included a cheesy (read that rushed) link of the audio. The audio is from a real cheap cube speaker I found at walmart for ten dollars. I prefer the headphones but for recording it works ok.

This radio along with the End Fed is fast becoming one of my favorite setups. Link is here: http://k0jqz.blogspot.com http://k0jqz.blogspot.com

Thanks to TJ, W0EA, for blogging about the battery I ended up using.

11894. MBDC Rig LCD Bezel and Installation notes.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-22 00:31:08 UTC
From: WA0ITP
Topic: 11894 Message: 11894

Thanks to all who responded to my query about a bezel for the 16x2 LCD. The PRD250B appears to be the correct one, it's available from Digikey, http://www.digikey.com/product-search/en?vendor=0&keywords=PRD250b-nd

Mounting the LCD behind the bezel and panel is a bit tedious but is easy enough. Long time QRPer and FB builder Dave Rogers, WB4CHK, details the process well. It is posted here with some slight changes on my part, and is posted with permission. Any mistakes are mine alone.

1. Selecting and preparing the Bezel:
The inside cutout of the bezel is smaller than the overall size of the bezel, so the bezel size is selected by the opening size needed for the LCD to be used. Plastic masks can be purchased that fit against the LCD face plate to mask off the unused part of the LCD face, also color filters are available. Note that the
snap in mounting attachments aren't used, and the "nibs" must be removed so the LCD can fit flush against the back of the bezel. There are also bosses at the corners on the back of the bezel that require removing. File them off so that the corners are square and the bezel will drop into it's opening.

2. Select and mark the LCD position on the panel:
Position the bezel on the panel, ands using it as a guide, mark the inside of the opening for the LCD Window. It's important to realize that the LCD fits behind the bezel and doesn't protrude thru the bezel opening. The LCD opening is smaller than the overall bezel size so the cutout size is not critical,
the Bezel flange will cover most cutting mistakes and ragged edges.

3. Cutting the LCD opening:
The cutout size is larger than the LCD opening so that the bezel will fit into it and cover the raw edges of the panel. The actual opening size for the PRD250B will wind up being approx 2 3/4" x 1 1/16". Measure your bezel first, or check the data sheet for the recommended opening sizel. Using a Dremel, or the drill and file method, cut out the opening and file it until till the bezel just fits into the cutout. Install the bezel and tape it to the front of the panel by it's edges, leaving the opening clear of tape. The bezel flange will cover the ragged edges of the opening.

4. Preparing the LCD:
Four 4/40 flathead phillips screws one inch long are used to mount the LCD. There are four mounting holes on the corners of the LCD pc board which need to be enlarged. Using a 1/8" drill, CAREFULLY drill them out to accomodate the 4/40 screws. Insert a screw in each hole, flat head toward the front of the LCD, and place a 4/40 nut on each screw, don't tighten the nuts yet. After drilling the LCD holes note that the screws are loose in the holes.

5. Installing the LCD:
Place the LCD with the screws loosely attached on the inside of the panel. Hold it in place with one hand and look through the front bezel opening to center the LCD inside the Bezel opening. When satisfied use masking tape to hold the LCD in place.

6. Recheck to make sure the LCD is positioned in the center of the bezel opening. If not, recenter and retape it until you are satisfied with the position. Then place the panel face down on the bench, the screws will drop into place against the inside of the panel. Align them vertically, and adjust the position of the 4/40 nuts so the flat heads of the screws are just in contact with the panel. These screws will become the mounting posts for the LCD.

7. Place a drop of instant (cyanoacrylate) glue on each screw head. After it cures, remove the 4/40 nuts, carefully remove the masking tape, lift off the LCD, and also remove the bezel from the front of the panel. Add a dollop of epoxy to permanently attach the screws,

You now have an LCD ready front panel with a bezel cut out. At this point label, decal, paint, letter or otherwise decorate the panel as you desire.

8. Finish the installation:

Install the bezel with a drop or two of glue and hold it in place with masking tape until the glue cures. Contact cement, epoxy, instant glue all will work fine, White glue can be used if you think the bezel may needed for another project in the future, it will pop off easily. Again, note that the snap in mounting attachments aren't used, and the "nibs" must be removed so the LCD can fit flush against the back of the bezel.

Install the LCD by sliding it over the 4-40 screws and snugging the nuts down so the front of the LCD butts against the back of the bezel. Be very careful not to over tighten the nuts and pop the screw heads loose from the panel. Finger tightening will adequate in most cases.

Hope this helps

Hello folks,
after keeping the kit in a box for months, i decided to build it. After few hours of (hard) labour, the sn 249 is operational.

What a wonderful transceiver, exactly what I wanted to do QRP on vacation.

Huge thanks to Steve for all the work required to design and deliver this kit.

This might be a good time to try your hand at a pcb fabricated chassis. With a little effort you can make a strong, attractive, individualized chassis for this project.

11902. MBDC Info and Assembly notes.

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-23 01:29:18 UTC
From: <k7dd@...>
Topic: 11902 Message: 11902

My radio arrived last week and I finally got time to get busy with assembly and looking for the case I wanted to put it into.
The case I had was just a hair (Red) too narrow to put it into but would have been a very compact product. It just made me nervous having to sand the sides of the board down a bit to fit and still need a shade more room.
Circuit Specialists in Tempe Arizona. They have a box that is just perfect save it is a bit heavy because the top is steel and the front bottom and back and front are aluminium. The aluminium has a plastic film on it for make up and drilling. It peels off when done and are ready to paint.
Model of the box pt # is E-2. Price? $8.25 and they had 13 left in stock when I got mine yesterday. It cost more in gas to drive over and get it...
Not much description but the black outer steel case is in a spatter knockdown texture much like Drake radios had.
http://www.circuitspecialists.com/e-2.html http://www.circuitspecialists.com/e-2.html

A few quick notes on the assembly instructions and parts count.
There are two 470pf caps that are on the board but not listed in the parts list or the assembly BUT they are on the schematic and the board.
There is a miss label of C26 in that it is not listed on the assembly list. It is there.
If you have ANY doubts in the assembly, check the schematic against the board and the parts list.
I had a spare diode in my kit. Thank you Steve. ;>)
TAKE YOUR TIME sorting all of the resistors out and check each one with a VOM so you KNOW what values you have and how many. It is REALLY easy to accidentally put a 220K resistor in place for the 220 OHM resistor or 22K resistors. I know because in my haste I had to take a few parts off and exchange them for the correct ones. Wasted time that could have been prevented IF I took my time and didn't try to do it just before bed. Zzzzzz.
I just figured if I can do it, anyone can so check your parts FIRST. ;>)

Thoughts:
Although I have drilled the bottom of the chassis to match up to the band and antenna switches it occurred to me that maybe a pair of small DIP latching relays could be used with a single push button to do the band changing from the front panel. Any thoughts on that from the collective?

At one point I also thought about putting a pair of antenna jacks on the back and latching relay switch them as well for separate antennas. Maybe later.
Now if I could only accomodate some sort of band switched front end filter so it would make a good GP receiver. I will try it with and without filters I currently have to see how it plays...

So far the hardest thing is accurately cutting the rectangular hole for the display. My hand is still sore from the nibbler but it is taking shape.

I have used the.100 pin headers through out the rig so everything is a plug in for ?
Because it makes it look nice..

When finished I will post pics to the files section.

I was hoping to get it finished for the 160 contest and Sweepstakes so lets see how close I can get.

BTW, did everyone go crazy on 10M the last few days? WOW, nice to hear it back to life for however long it lasts.

MBDC Builders,

I'm not finished putting my unit together yet but I thought I'd let everyone know that R7 is shown as both 224 and 22K in the parts list. Of course the correct value is 220K. 73,

In the manual, a preselector is mentioned for possible use when using the rig as a general coverage receiver. Does anyone have plans for a preselector that would be appropriate?

And if you are going to try fabricating a board from pcb material you might want to check out the clamps that Rex W1REX sells on his QRPMe site, http://www.qrpme.com/docs/SBSS.pdf. Mine just arrived in the mail, haven't had a chance to use them yet but I certainly will soon.

When I get a chance, I'm going to try a small, tuned loop. Maybe a foot across so it can sit on a table near-by. Not only does it provide selectivity, it cuts down on noise.

Steve KD1JV

MBDC Builders,

I haven't had much time to work on my MBDC today but I noticed that the fourth item in the capacitor listing reads:

68 (68 pfd, MLCC) – 2 places – C28, C29 Be careful not to mix up with 680 pfd (681) caps

but should read:

68 (68 pfd, MLCC) – 2 places – *C27*, C29 Be careful not to mix up with 680 pfd (681) caps

From: <steve.kd1jv@...>
Topic: 11909 Message: 11909

I just up loaded an updated MBDC manual with the missing 470 pfd caps in the placement listing and corrected the C27 typo. With only these two mistakes, I did pretty well this time, eh?

I also added a Chinese seller URL for the display and DDS module to the manual, so you don't have to search for it. I would recommend getting these parts soon if you haven't already as we don't know how long they will be available. You don't want to sit on this kit for a couple of years and then find out the critical part is no longer available!

Humm, that message wasn't suppost to go the the group. I guess I accidently clicked on someone who replied to the group and not to me directly. Which brings up the issue of a couple of DX stations I don't have email adderess for.

These are:

M3WCK, VK2RH, G3XLG, G4ISJ, G0BPU and F6GWE.

If your on the above list, fell free to use the link to the paypal button.

Hi folks,

Not a lot of mountains to climb here, but several islands to visit in the easter-sea.
When going to Ha Tien, close to the cambodian border, I often take my MTR (or LIR in that case) with me.

This time, we were a party of 6 including my parents, my XYL and my 2 kids.
In five minutes I can have my station up and running from the hotel room on the top of the cliff. The second day we also rented a boat to go cruising in the bay, fishing a little and relaxing on a small island. Once again the MTR was ready in a few minutes.

Some pictures and more details in french on my blog :

Earle-
I'll add my comment to others that you've done a wonderful thing here!! There is a wide range of experience in the group, and folks (like myself) that are just coming up to speed on the technologies involved will gain allot from your effort. I never thought of the MTR as a sort of Elmer project, but I think you've made it just that. Thanks much!!

Wayne
W6AHH

---In AT_Sprint@yahoogroups.com, <at_sprint@yahoogroups.com> wrote:

Hello Everyone,

Ever since I set out a year ago to learn how transceivers work by building a NorCal40A while reading David Rutledge's "The Electronics of Radio," I have preferred to build kits such as the MTR section by section, testing each section as I complete it before moving on to the next section. Starting back in June with the latest MTR, I followed this method of referring mainly to the schematic, and I made measurements and took photos of the changing printed circuit board and the measurements that I made. One important caveat when building a radio section by section is to read through the entire assembly manual first and note any modifications or discrepancies between the parts list, the assembly instructions, and the schematic in order to ensure proper installation of the components.

I have written a description of the function of each section, and, after getting Steve's Ok, because I felt that it was important that he knew what I was doing, I have uploaded 19 pdfs to a folder labeled AB6WL. I have titled this series of documents "Toward Understanding the MTR: and other Superheterodyne Receivers and Direct Synthesis Transmitters." The word "Toward..." means that I do not yet understand everything completely, but I am working on it. Each section's description is numbered according to the order in which I built it, so that the names of the 19 files are as follows --

1_Power Supply
2_MCU & Display
3_40 MHz Reference Oscillator
4_Direct Digital Synthesizer
5_DDS Local Oscillator Lowpass Filter
6_20m Transmit Lowpass Filter
7_40m Transmit Lowpass Filter
8_20m & 40m Receive Bandpass Filters
9_Transmit Receive MUTE Switch - Part 1
10_Receive RF Mixer
11_Receiver Intermediate Frequency Crystal Filter
12_Product Detector and Beat Frequency Oscillator
13_Receiver Audio Preamplifier
14_Audio Amplifier & Automatic Gain Control
15_Transmit Receive MUTE Switch - Part 2

16_Audio Bandpass Filter
17_Transmit Drivers
18_Finals V+ Shaping & TR Switch - Part 3
19_Finals Transistors Power Amplifier

My suggestion is that you print out the schematic of the MTR on pages 22 &b 23 of the manual so that you can refer to it while reading through my explanations of the different sections. You could even print out the schematics for any of the ATSs on this website, or of the Weber Tribander or PFR-3A on Doug Hendricks' website qrpkits.com to compare the variations in Steve's designs.

Steve's MTR, with both its simplicity and its sophistication on a two-sided printed circuit board smaller than a credit card, presents a great opportunity to understand the various parts of transceivers, especially when it involves classic circuit designs that go back to the beginning of the 20th century and World War I. My hope is that others like myself who are limited in their understanding can benefit from my explanations. I have certainly benefited from trying to explain the MTR, especially the trigonometric relationships of mixer signals described in Section 12 on the Product Detector. Steve has answered questions for me along the way, and I would also welcome from the group any advice on making corrections or clarifications.

73,

Earle

AT SprintHi All,

The ATS-3 is indeed the penultimate backpack radio in my view. However, I would defer to the opinion from folks like Fred Maas, KT5X, about that. The ATS-4 is a significant improvement in ease of operation and features, and not all that much bigger actually, but I can certainly see the appeal of the ATS-3 in certain situations. For one thing, my ATS-3B fits in my shirt pocket! My ATS-4 doesn't, but my usage isn't that demanding. Still, I'm probably as much, or more, likely to grab the ATS-3B, just in case I do want to just stuff it in a pocket.

I'm guessing that Steve could sell both rigs on an ongoing basis if he were so inclined to do so. He certainly hasn't had any problem in the past selling either one. Supply was always substantially below demand. What we don't know is what he has on the drawing board currently—I'm assuming there is something! I don't know about the rest of you, but I'm just sitting here, patiently waiting for Steve's next ingenious offering. Hope one comes along soon!

The ATS-4 is a significant improvement in ease of operation and features, and not all that much bigger actually, but I can certainly see the appeal of the ATS-3 in certain situations. For one thing, my ATS-3B fits in my shirt pocket! My ATS-4 doesn’t, but my usage isn’t that demanding. Still, I’m probably as much, or more, likely to grab the ATS-3B, just in case I do want to just stuff it in a pocket.
>
> I’m guessing that Steve could sell both rigs on an ongoing basis if he were so inclined to do so. He certainly hasn’t had any problem in the past selling either one. Supply was always substantially below demand. What we don’t know is what he has on the drawing board currently—I’m assuming there is something! I don’t know about the rest of you, but I’m just sitting here, patiently waiting for Steve’s next ingenious offering. Hope one comes along soon!

That's the cool thing about the MTR IMO...two switchable bands, and can be
enclosed in an Altoids tin like the ATS3 if desired...best of both worlds
if you can be happy with two bands.

I'd say that's a pretty safe bet!

11924. Next generation of the MTR...

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-30 17:43:29 UTC
From: Steven Weber
Topic: 11924 Message: 11924

Isn't there a new MTR in the pipeline? Three bander, touch keyer and DSP? I love the size of my MTR and would definitely prefer something of the same size.. The last MTR case was great, but a bit thick.. It could have been a third thinner.. In any case, I am definitely waiting for the next MTR!

Yeah, I got to start thinking about that soon now that the MBDC rig is pretty much done and gone.

I experimented with the touch keyer and it was a flop. For a keyer were timing is important and also have to generate side tone, adding touch sensing just screws everything up. I came to the conclusion that a seperate chip has to be dedicated for switch sensing to work reliably and not interfer with keyer timing. Maybe I'll design a touch paddle accessory some time which can be added latter.

I'm still debating on the miniDSP chip. It would eliminate most of the analog parts and reduces the background hiss a lot. The problem is, it's an expensive part ~ $7.00 in 100's and can't be hand soldered. So, I'll either have to premount it for you or stop suppling wire solder and make you all get and use solder paste - which isn't too bad an idea, since these boards really should be built that way.

The next question is that of a display. I can get a nice back lited LCD Nokia display from China, cheap. It can display 6 lines of 10 characters and has digits large enough to be easy to see. But at 1.7" square, it is a little large and I won't be able to put parts under it, as it would be soldered to the board to keep the profile low. I can get a much smaller LCD display at much higher cost, but the characters are pretty tiny too. Or I can stick with the single digit LED display, which is better then nothing. Maybe see if I can fit the next larger sized digit on the board.

Knob tuning? I'm still a little leary of this. The main issue is the protruding knob. Maybe I should buy one of those new low cost 3D printers and print my own low profile knobs and button caps for the TACK switches. Could probably print boxes too - hell there's an idea...

Speaking of boxes, the MTR box did turn out a little too tall and heavy. But then, a lot of you asked for a bullet proof box, so there you go. Discounting the rubber bumper feet, it's only 0.4" taller than an Altoids tin, but that extra 0.4" does mess up the proportions. So I guess next time I'll have it made a bit flater, along the lines of the ATS-4 boxes.

So, those are the thoughts I have now.

Speaking as an audience of one, a $7 difference in cost isn't going to make an iota of difference in my ability to afford a kit -- nor will it impact the XYL permission to buy. ;-) If a $7 part has significantly better characteristics, I'd say "Go for it." (If you're considering adding 100 of them to the design, that might impact.)

Hello Sir,

Here are my thoughts on these ideas:

The cost of having the DSP chip pre-soldered could be taken care of my having buyers put say $10 or more down to reserve their MTR…

The last MTR was pretty darn near perfect. An LCD display doesn't add any functionality but does add complexity and fragility. Three single-digit LED would be great, like Elecraft does on the KX1, but really, one is just fine.

Knobs are too big.

Hard to believe that the MTR case was only .4" taller than an Altoids tin.. It just seems much thicker. That said, it is bullet proof and I would very much like the same steel gauge, just a tad thinner. With a BNC, not an RCA for the antenna.

I use a KX3 and the MTR… If I had to get rid of one, the KX3 would get the boot, though it is an awesome radio, but the MTR is just perfect for what I like to do.

Thank you so much for making those jewels.

Gil.

My MTR has a BNC jack. Pretty easy mod, even for a mechanical klutz such as me.
No, it's not a D-shaped hole like it should be for all the BNC jacks I've seen, but the round hole I'm using does fine with the jack snugged up tight.

Just some thoughts about the MTR.
1. A touch keyer will require both a modification of both the board and the box. One idea, however, would be to supply the holes so that a multipin connector can be installed to plug in the board later.

2. A four digit LED readout like you have on the digital dial would be nice and not too big.

3. For a tuning dial, can you use a side wheel like you used on the ATS4 volume control?

4. The miniDSP sounds cool but would it do more than an audio filter?

Topic: 11932 Message: 11932

I have a "Fernando" radio. Billy Crystals character, whos famous line: "Its not who you are but what you look like, and you look marvelous!" describes my MBDC radio to a tee. Looks nice, fairly clean layout, backlight works, BUT it no play. No readout, no receiver.
Voltages to various points look ok, 4.89 vdc and 8.91 vdc with 13.2 vdc at the power plug.
I am sort of at a loss as I don't know what to check next. I will go over all the parts one by one to confirm I didn't make a goof even though I did that twice before it went into the cabinet and I found a pair of resistor mistooks (22K and 220K are quite different).
Any suggestions would be a great help. Test equip is a VOM, watt meter, and if I drag it in from the garage, a 100Mhz Scope.
Thanks
Mike Baker K7DD

From: Håkan Olsson
Topic: 11924 Message: 11933

Referring to my own experience (http://hem.bredband.net/b101180/In%20the%20field.html) here?s some thoughts about the next generation of the MTR.

Skipping the touch-keyer was a good thing. The number one priority for any keyer used in the field is that it can handle dirty, wet and damp conditions and, most important, that you can fix/service it with simple tools like a pen-knife. The AME Porta-Paddle II sure is not the best keyer in the world but it sure is better than the Begali for field use!

Three bands? Quite enough! 80, 40 and 30 meters for us on the other side of the Big Pond.

Display? During SOTA operations, for which the MTR is intended, you usually stay on one frequency. You seldom scan frequencies. You are the DX. In spite of that comparing the ATS-3B.1 with the ATS-4 series and being able to see the frequency sure adds to the ergonomics and your feeling of security. Would willingly pay extra for that!

MiniDSP chip? Why not? If it includes AGC, band pass filtering, sidetone generation (with level control), electronic volume control and headphone driver. We all have to follow the times and the new trends. If it reduces the component count and make the construction more simple and even make it more rugged, a few extra dollars would not matter. If it have to be pre-mounted, so be it!

And yes, AGC is VERY, VERY important! Particularly for SOTA and SMFF operations when you are in the middle of a pile-up.

Tuning knob? I would say yes even if it would cost extra! But why does it have to protrude? A wheel on the side like the volume on the ATS-4 series would be much better. The crux is to find a counter small/low enough so that the enclosure would not be to thick.

A way to more reliably adjust the output power to exactly 5 watts would be nice. Some way to reduce the power independently of the voltage would be even nicer, even if you have to open the box to do it.

I can understand your desire to keep the price below the 200 dollar range, but don?t worry, aim to keep it below the 300 dollar range instead. Few will complain, trust me!

H?kan / SM6EQO

Speaking of 3D printers, mine should be done this weekend. If you're really interested in doing parts and don't want to buy/build a printer, maybe we can work out a trade...parts for a kit or two. Maybe do the cases separately so people can get customized cases (I.e. light, heavy duty, add your call sign, etc).

Steve:

1. Please don't 3D print the case. I know all the cool kids are into 3D printers now, but these devices have some serious limitations. The plastic they extrude isn't very durable, and they don't print fast enough for even small-scale production runs. They're for prototyping things with weird shapes, not banging out boxes that need to survive in backpacks. A rectangular metal case is what the MTR needs.

2. A $7 - or even $20 - price hike isn't going to change anyone's purchase decision on these things. A little more cash for a friendlier interface seems like a good deal to me.

3. Make it as small as possible, but no smaller.

4. Include a pony.

I disagree about the durability of 3D printed items. That depends on the filament used (there are some pretty durable plastics), the design of the case, and the print settings (i.e. % fill).

The speed is definitely an issue. I'd guess that I could probably print 3 or 4 cases at a time, top and bottom. If I averaged one run a day (I do have a life), it would take about a month to make 100 cases. However, doing something like a knob or thumbwheel, I could probably print a lot of them in one run and could probably knock it out in a week.

BTW, I despise Yahoo Groups. I posted one response yesterday, waited a while, and still didn't see that it actually posted. So I posted again. A few hours later, it's still not up. Was going to try again this morning and found that they both posted. Why does it take several hours to post something? It's instantaneous on good forums. Sorry for the rant, I just really really HATE Yahoo Groups. Too bad most Ham radio users seem to love them.

Hey, folks:

I never said you couldn't print boxes with a 3D printer. Of course people do it all the time. That doesn't make it the optimum solution for every box-related problem. You can also drive nails with a torque wrench, but if you have access to a hammer it's a much better choice.

It is said that when the only tool you have at your disposal is a hammer, every problem looks like a nail.

11943. Re: Next generation of the MTR...

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-10-31 15:09:21 UTC
From: cloud runner
Topic: 11924 Message: 11943

I speak from the position of 1,800 SOTA Activation points. I find myself largely in agreement with others ...

* dont want a touch paddle in the field, or anywhere else for that matter. (On SOTA's I use a homebrew paddle that weighs six grams and mounts inside the radio case, sliding out for use).

* don't care about a tuning knob

* ambivalent about additional LED digits, small LCD screen more interesting, but not necessary.

* bands ... my band use based upon total SOTA QSO's are in this order; 20M, 40M, then of much lower interest 30M, and way down are 17 and 15 (because before much timepasses these bands will rarely open for years to come). This is a daytime field radio for me, never operated 80M on a SOTA peak, but glad to have the band in the ATS4.

but with these different wishes:

* Speaker: I found on eBay for six bux including shipping a very small amplified speaker, and i love to use it! Ear buds are forever falling out of one ear or the other, plus the endless minor annoyance of untangling the wires each time I take them out for use, plus many times I can not hear because of wind. The speaker with internal battery weighs just an ounce and a half, comes with its own power which runs it for several hours. It is recharged from a USB port on the computer. Inside is a lion button battery and a circuit board to control voltage and amplify.

http://www.ebay.com/itm/Mini-Hamburger-Stereo-Speaker-Music-Player-for-iPhone-iPod-PC-Laptop-Black-MP3-/310649285359?pt=US_Audio_Docks_Mini_Speakers&hash=item485423eaef

My greatest want would be to have a speaker like this internal with the radio. I can imagine the speaker being activated by the jack such that IF you have a headfone plugged in, the speaker is off. The speaker and circuit board separated from case might weigh less than a half an ounce, same as a set of earbuds. When on, it could be powered by the same battery running the radio. Power drain must be small to run for two hours from an internal button battery, and non-existent if the operator elects earbuds instead.

It could be a daughter board stacked in the case, rather than on the radio board, I think it could be able to fit. It occurs to me that it could be a separate kit, and it surely would fit easily inside the MTR ver 2 case!

* Voltage control ... I have a voltage controlling switch that I use with my MTR and ATS4. Purpose is to turn the power down during tune up. It would be super cool if the menu "tune" mode automatically reduced power out making such a voltage switch redundant.

Overall, this is a great rig as is. It is very sensitive. I work people that monitoring stations say they can't hear. Keying is excellent, QSK is wonderful, AGC action is pretty good and good enough. It is resistant to IMD enough that a KX3 operating 50 yards and three

khz away is tolerable. Two bands, 20/40 is fine for me. I don't need a knob and I don't need the LCD screen or extra digits.

Subject: Re: [AT_Sprint] Next generation of the MTR...

Referring to my own experience (http://hem.bredband.net/b101180/In%20the%20field.html) here´s some thoughts about the next generation of the MTR.

Skipping the touch-keyer was a good thing. The number one priority for any keyer used in the field is that it can handle dirty, wet and damp conditions and, most important, that you can fix/service it with simple tools like a pen-knife. The AME Porta-Paddle II sure is not the best keyer in the world but it sure is better than the Begali for field use!

Three bands? Quite enough! 80, 40 and 30 meters for us on the other side of the Big Pond.

Display? During SOTA operations, for which the MTR is intended, you usually stay on one frequency. You seldom scan frequencies. You are the DX. In spite of that comparing the ATS-3B.1 with the ATS-4 series and being able to see the frequency sure adds to the ergonomics and your feeling of security. Would willingly pay extra for that!

MiniDSP chip? Why not? If it includes AGC, band pass filtering, sidetone generation (with level control), electronic volume control and headphone driver. We all have to follow the times and the new trends. If it reduces the component count and make the construction more simple and even make it more rugged, a few extra dollars would not matter. If it have to be pre-mounted, so be it!

And yes, AGC is VERY, VERY important! Particularly for SOTA and SMFF operations when you are in the middle of a pile-up.

Tuning knob? I would say yes even if it would cost extra! But why does it have to protrude? A wheel on the side like the volume on the ATS-4 series would be much better. The crux is to find a counter small/low enough so that the enclosure would not be to thick.

A way to more reliably adjust the output power to exactly 5 watts would be nice. Some way to reduce the power independently of the voltage would be even nicer, even if you have to open the box to do it.

I can understand your desire to keep the price below the 200 dollar range, but don´t worry, aim to keep it below the 300 dollar range instead. Few will complain, trust me!

Håkan / SM6EQO

The only thing I can think of is make sure the processor is plugged in the correct way. (The power pins are set up so there is no damage if inserted backwards).

When you turn up the LCD contrast control, do you see 16 black boxes across the top line?

If you try transmitting (might be a good idea to remove the PA choke toroid before you do this) do you hear side tone? (that would let you know if the processor is doing something)

Check the wiring to the tuning encoder - a short to ground on one of the switch outputs could lead to a "stuck switch" condition which hangs up the processor.

Steve KD1JV

I have a "Fernando" radio. Billy Crystals character, whos famous line: "Its not who you are but what you look like, and you look marvelous!" describes my MBDC radio to a tee. Looks nice, fairly clean layout, backlight works, BUT it no play. No readout, no receiver. Voltages to various points look ok, 4.89 vdc and 8.91 vdc with 13.2 vdc at the power plug.

Since we've entered a discussion on the MTR's niche...

I have a KX3. It's a really nice field radio, except it's the size and weight of a brick. No point in competing with the KX3 (unless you can fit it in an Altoids tin!)

Since I don't have an MTR yet, I've looked at other tiny, light field radios, such as http://www.qrpme.com/. Compared to the MTR, they lack power, performance, and efficiency.

MTR offers 5W power, top-notch performance (receive sensitivity, good transmitted signal), multiple bands, power efficient operation in a tiny, lightweight package. That's its appeal. After that, I say, "Whatever makes it fun for Steve to design and kit," because that's what will make the next one happen!

Okay, some good ideas to be considered.

Fred, I don't think I could squeeze in a speaker and keep the box small. At least not if we try going back to a shallower box. I have a small, low profile speaker I think will fit into the bottom of the MTR case, I'll have to give that a try and see how it sounds.

Voltage control would be nice. That's something which has been in the back of my mind for some time, but haven't hit on a good way to implement it yet. There are a couple of minor issues, like how to control the voltage and the possible need for heat sinking. I need a processor with built in D/A.

I wish someone made a side adjust, thumb wheel like encoder like the transistor radio volume control used in the ATS-4's. That would be the best solution.

The main problem with the miniDSP is that it needs a lot of data to be loaded into it, at least 4K bytes worth. Most of that are the DSP instructions and data, which has to be changed if different filters are to be implemented. Since I have to pretty much enter all that data manually into the assembler, I want to keep it as simple as possible.

Other things, like setting the master volume and switching the side tone in and out is pretty straight forward. AGC is a function which is built in.

I guess it time to start doing R+D...

Couldn't you use a pot as a voltage divider to feed an analog input on the microprocessor and use that to control frequency? I suppose the frequency range would be pretty limited with a standard thumbwheel pot though....perhaps several selectable ranges?? A multi-turn thumbwheel pot would work pretty well, but it's probably about as likely to find that as a thumbwheel encoder!

N0, the miminum voltage is 11 volts. Most of the stuff runs off a 9V regulator and that needs 2 volts of head room to operate. Due to the high receive current (125 ma), I would recommend a moderate sized gell cell if you want to run this one off batteries.

One step closer.

I have a display that says 125.000000 CAL.

Tuning knob still does nada but I will check the wiring again on Friday.

No side tone, no tx.

The DDS board is plugged in exactly as the picture indicates and the red LED is bright.

I assume the processor you are referring to is the large chip under the end of the DDS board. It is in the correct way. Notch to the right under the DDS. All chips checked for proper location and orientation.

Up for round two.

Hi Steve, folks,

Just about the screen.
Like Gil I am not sure of the added value of bigger display.
That said the "Nokia 5110"-like display modules are great. A bit expensive compared to 16x2 HD44840 displays, but much more versatile.
THe problem I had with them is a big variation in quality in the same lot.
I bought around 50 of them and 5 were not working, 5 otters showing troubles.
The problem is that they are designed to be installed pressed again a PCB.
The chinese suppliers built a PCB and a metal frame to sold it as a "module". However, I found that mechanical stability is very bad and with bad contacts the resistance increase bringing malfunctioning of the displays.
All in all still a good deal, but take care...

> The next question is that of a display. I can get a nice back lited LCD Nokia display from China, cheap. It can display 6 lines of 10 characters and has digits large enough to be easy to see. But at 1.7" square, it is a little large and I won't be able to put parts under it, as it would be soldered to the board to keep the profile low. I can get a much smaller LCD display at much higher cost, but the characters are pretty tiny too. Or I can stick with the single digit LED display, which is better then nothing. Maybe see if I can fit the next larger sized digit on the board.

My thoughts/opinions to add to the MTR evolution discussion...

The screen issue -what do we need it for again?? Digital noise, flaky contacts, added current draw, all for the ability to display...? If we needed to display information you could use a couple of small LED's poking through the case, a momentary button that turns on the light show so you can see what's lit up and then know your settings. When they're off, there is no current being used, no PWM noise etc etc.. The paddle controls the settings.

For the MTR, the ultimate expression of an ultralight micro transceiver, I think a display doesn't quite fit. I know Steve and other talented designers could work magic with a DSP and a display, but maybe reserve it for a more PFR-esque type of rig.

The only thing driving the MTR design should be "How can I make lugging a radio xcvr to the top of this hill less of a strain on the hiker while continuing to offer (and improve upon) great transceive performance.?" So the MTR, if anything, should get smaller and lighter. If it has to have more bells and whistles then perhaps a built in tuner and battery pack. (Less stuff for the hiker to carry). As far as batteries, it should be designed around a Lipo or Lion 7.4v pack. Anything else and the size grows and grows. We can handle spending the extra for the charger.

W2STV clear

I agree that the display isn't all that necessary, but it does provide some
convenience . I built my ATS-3b "upside down" so as to show off the lid -
I just open the lid to push the buttons to control the rig - the CW
annunciations are fine...everyone operating these rigs knows Morse! ;-)

For me, a display of some flavor is very helpful. At east to display frequency. I would like the new rig to be smaller than my ATS4 and band switching. Two band 20/40 or three band 20/30/40 would be good. Pre made case is a big plu - I suck at the metal work. The big driver for me is the smaller size.

Isn't there a new MTR in the pipeline? Three bander, touch keyer and DSP? I love the size of my MTR and would definitely prefer something of the same size.. The last MTR case was great, but a bit thick.. It could have been a third thinner.. In any case, I am definitely waiting for the next MTR!

Yeah, I got to start thinking about that soon now that the MBDC rig is pretty much done and gone.

I experimented with the touch keyer and it was a flop. For a keyer were timing is important and also have to generate side tone, adding touch sensing just screws everything up. I came to the conclusion that a seperate chip has to be dedicated for switch sensing to work reliably and not interfer with keyer timing. Maybe I'll design a touch paddle accessory some time which can be added latter.

I'm still debating on the miniDSP chip. It would eliminate most of the analog parts and reduces the background hiss a lot. The problem is, it's an expensive part ~ $7.00 in 100's and can't be hand soldered. So, I'll either have to premount it for you or stop suppling wire solder and make you all get and use solder paste - which isn't too bad an idea, since these boards really should be built that way.

The next question is that of a display. I can get a nice back lited LCD Nokia display from China, cheap. It can display 6 lines of 10 characters and has digits large enough to be easy to see. But at 1.7" square, it is a little large and I won't be able to put parts under it, as it would be soldered to the board to keep the profile low. I can get a much smaller LCD display at much higher cost, but the characters are pretty tiny too. Or I can stick with the single digit LED display, which is better then nothing. Maybe see if I can fit the next larger sized digit on the board.

Knob tuning? I'm still a little leary of this. The main issue is the protruding knob. Maybe I should buy one of those new low cost 3D printers and print my own low profile knobs and button caps for the TACK switches. Could probably print boxes too - hell there's an idea...

Speaking of boxes, the MTR box did turn out a little too tall and heavy. But then, a lot of you asked for a bullet proof box, so there you go. Discounting the rubber bumper feet, it's only 0.4" taller than an Altoids tin, but that extra 0.4" does mess up the proportions. So I guess next time I'll have it made a bit flater, along the lines of the ATS-4 boxes.

So, those are the thoughts I have now.

I have activated a few sites in Montana, and now that the summer season is over, here are my impressions. The KX3 works great, and the built in tuner and battery were useful. It is relatively heavy, and will be replaced by my MTR next season.

I plan to build a new case for the MTR that I already have. The new case will have room for a small rechargeable battery, a tuner, and SWR indicator. A recessed slide switch will be used for an on/off switch. Also, a diode will be used for reverse voltage protection-- don't ask me why I think it is needed. I have small sheet metal brake and shear, building boxes isn't that tough.

Activation antennas that I used this summer were half wave dipoles fed with coax. Trees were used for support, but a fiberglass pole was used when necessary. Even though the dipole was cut for 20m, characteristics are affected by height above ground, so I feel that a tuner is needed.

Almost all of my operation, both as a SOTA chaser and activator, has been on 20 meters. Activators who are on 30 and 40 meters are seldom readable in Montana. There are no local chasers who would listen for me on 40. So, a monoband 20 m rig would be fine for me.

Maybe a volume control would be useful for Steve's new rig.

A larger display would be nice, but once the pile up has started, there isn't time to look at much more than the log book and key.

By the way, I still hand solder components. I am a kit building junkie, and will build and buy anything that comes down the pipe. Thanks for your kits, Steve.

All my rigs have a diode built in. It's just silly not to design one in.

In the case of the MTR, it's part of a p channel mosfet which gets turned on when the polarity is correct. This effectively "shorts out" the diode and eliminates the voltage drop, which increases the power output a bit for the same battery votlage. Which is why the MTR typically runs a bit closer to 3 watts out instead of 2.5 with a 9V supply.

But, if you have other accessories to power, then those might need a diode of thier own.

Sounds like you definately have a stuck button. Turning power on with the MENU switch depressed enters calibration mode. Since it's doing this on it's own, the switch is shorted closed. The processor is waiting for the switch to open before it can do anything else. Find that short and it should come alive.
Steve

One step closer.

I have a display that says 125.000000 CAL.

Tuning knob still does nada but I will check the wiring again on Friday.

With respect to battery ... simply want to mention for Steve's clear understanding ... I have been running my MTR on SOTA activations using a 3S LiPO that is rated 180 mAH, is smaller than the typical 9 volt transistor battery, and weighs 23 grams. It is good for about two hours of active operating, and most SOTA activations last between 20 and 40 minutes.

I have my MTR in a slightly larger case than an Altoids tin, but it isn't entirely satisfactory. The home made paddle mounts inside, slides out for use. Battery mounts inside. mini-space-pen is stored inside and tethered to the box. I hold the radio in my left hand and I have a 3x5 card for a log clipped on the back. This entire thing weighs less than 7 ounces, radio, battery, paddle, log, pen.

FWIW, that;s how I use it. I plug in earbuds and antenna, and I wouldn't mind getting a mini speaker inside, too.

photo shows ATS4 on left, and the MTR on right, with the battery outside just to see it... you can also see the thumbnut by which the paddle slides out for use. 3x5 card is fitted on the back.

Like Fred, I wouldn't change much. I don't think the display should change and the single led digit is fine for me. I would like to see the ability to decrease power for tuning and battery saving for extended trips/activations. Other than that, I'd like to see the rig be able to handle a bit higher voltage to be able to safely use a standard 13.8v power supply, or at least a 3s lipo.

It doesn't really matter much, 8 turns is likely better if you want tune down below the AM broadcast band.

Hi Steve,

Well, it would appear that I had a senior moment when purchasing two pushbutton switches for the rig as I accidentally got NC instead of NO. Duhhh.

Change the switches and now I have display.

Still no side tone, transmit, nor receive. Took a small cap and an alligator clip jumper wire from the antenna connection and started probing. The two LM386 dips seem to be working as I do have some receiver hiss that I can adjust the volume and then prodded with my test lead I can hear all kinds of local AM stations, all at once. I don’t seem to be able to hear the DDS output in an external receiver with the output pin connected to the antenna lead but I will attempt to use a better direct connection to test that out.

So, progress is slow but it is being made. I’ll keep chipping away at it.

Thanks for your help so far.

Just some random thoughts here for what it's worth:

1) I think the case that has room inside to accommodate an internal LiPo battery is great. Yes, it would make the overall size larger but it would integrate things so you don't hike 5 miles in and realize you forgot your external battery. There's currently enough room in the existing case to house a 9v battery but I think a little larger capacity LiPo would be ideal.

2) What about a voltage regulator that can handle up to ~18v input so guys could run it straight off a basic solar panel or 3S or 4S LiPo's?

3) Have an integrated on/off switch for said internal battery.

4) I like the idea of a tuning knob but keep it very low profile so it doesn't get broken off. My biggest complaint about my KX3 is the huge knobs just asking to get broken if the radio take an accidental tumble. The KX3 knobs could be 1/4 the height and still be useable, yet more sturdy. Perhaps have a case design with raised edges so the dial/panel is somewhat protected?

5) Standard BNC for antenna.

6) Whatever the display is I would prefer a basic non-illuminated one over a red/backlit display, but I'm probably in the minority there...

Well, the new Palm Micro paddle is 2"x.6"x.6" and probably smaller without the outer covering. It would be very cool (but a bit of a mechanical design challenge) to integrate this or something similar with the case. Don't worry about getting carried away -its all brainstorming at this point, a place for Steve to hear all sorts of ideas. Even if he changed nothing, the MTR is still a kickass design all around.

From: <rikluost@...>
Topic: 11972 Message: 11972

Hi all,
got my MBDC going for the first time this morning, seems all good, but sensitivity is very poor - using signal generator -85dBm is almost impossible to hear - so some 25-35 dB more than one would expect. Something is obviously wrong - but what?

- I used ANT2 connector to bypass the 160/80 filters.
- I've checked all supply voltages,
- visual check of soldering looks ok
- double checked most of the component values around the receiver bits
- the transformer is correctly wired and the ends of wires are well connected to the circuit.
- Have not tried TX yet.

Running out of ideas here - any thoughts?

Cheers,
Riku ZL1KLP

If your measuring in wide band mode, that is probably about right. Switching in the audio filters adds gain with each stage, so the NB2 setting has the most sensitivity.

I didn't try to make this overly sensitive for several reasons. First, because of the typically high levels of atmospheric noise on the top bands, too much sensitivity just brings out the noise. The S/N ratio just gets worse, not better. Second, for casual SWBC or AMBC listening, you don't need a great deal of sensitivity. Third, your probably only going to use this for local communications and the other guy is likely going to be running a lot more then 5 watts...

The NB filters add gain as your probably going to need more sensitvity for CW reception and they also help improve the S/N ratio by narrowing the bandwidth. So, that's where I added the gain.

Finally, if you do add a preselector to the receiver or a tuned loop, you can add a preamp there...

Thanks Steve, yes it makes more sense now, On the lower bands where noise levels are so high that added sensitivity will not give much - but probably only adds to problems.

Last night I tested with my active antenna (pa0rdt) and with that one I got very good results. Gain of it might be a bit too high as I quite easily hear 2nd or 3rd harmonics.with it - some even with filters.

With narrower filters I got the sensitivity down to about -95 to -90dBm by ear - so not very accurate measure - but definitely better.

Preselector is defenitely on the list of my add ons. Wonder if anyone has already sketched up one suitable for DC-30MHz...?

Cheers,
Riku ZL1KLP

If your measuring in wide band mode, that is probably about right. Switching in the audio filters adds gain with each stage, so the NB2 setting has the most sensitivity.

I didn't try to make this overly sensitive for several reasons. First, because of the typically high levels of atmospheric noise on the top bands, too much sensitivity just brings out the noise. The S/N ratio just gets worse, not better. Second, for casual SWBC or AMBC listening, you don't need a great deal of sensitivity. Third, your probably only going to use this for local communications and the other guy is likely going to be running a lot more then 5 watts...

The NB filters add gain as your probably going to need more sensitvity for CW reception and they also help improve the S/N ratio by narrowing the bandwidth. So, that's where I added the gain.

Finally, if you do add a preselector to the receiver or a tuned loop, you can add a preamp there...

I used SIP sockets for the ICs, thinking they were better quality than the sockets that were included in the kit. Don't use these for the big DDS module because the pins won't fit into SIP sockets. Good luck--

Hey, folks:

Nobody but Marissa Mayer likes the new Yahoo:

http://www.theregister.co.uk/2013/09/17/yahoo_groups_complaints_continue/

I suggest directing your complaints to the Yahoo Groups customer service forum:

http://yahoo.uservoice.com/forums/209451

Unlike this list, Marissa's minions actually read that forum. Don't expect much, though. You can see from reading through the previous complaints and Yahoo's responses that they have no intention of rolling this crap back.

Hi Wendell & Group

Now that is a useful tip: I had intended to use SIP sockets thinking, like you, that they would be more stable... and I just know that I wouldn't have checked the fit beforehand, so thank you for saving me (and, I'm sure, others) a lot of grief!

Oh, and you can install C17 if you want more gain. I think it's a little too much if your using a big antenna. Although it would be possible to add a resistor in series with the cap to set the gain to an intermediate value. That might be worth experimenting with.

Steve
Thanks Steve, yes it makes more sense now, On the lower bands where noise levels are so high that added sensitivity will not give much - but probably only adds to problems.

I think a big part of the problem is they make these major structual changes and then you got to figure out how it all works again on your own. We really hate learning to navigate a new set up. It also helps to have the latest browser and fast internet.

The big issue I find is I can't go to this group directly like I used to. I have to go to thier home page, then click on groups, then on the group I want. I suppose this makes some sense if your a member of a lot of groups. It also ensures traffic to thier home page and the new group format gives them a way to insert more ads.

So, it really boils down to getting used to the new format. Of course, once we do they will change it again...

After much hemming and hawing, my MTR is listed for sale on eBay.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=251372905468

Built by W0EA, it's a beauty (as many of you know). I put together quite the package for it, with a nice Pelican case, micro paddle, and room to spare for an antenna.

Determined my KX3 is all I need and having twins this year has greatly reduced my radio time. Looking to fund a 3D printer to start looking at modeling/printing radio related items. I realize there are many interested who are international, but I simply don't have the time to figure out costs and deal with customs shipping forms and such.

Videos included in the listing showing the MTR in action. Sad to see it go, but I know someone's itching to get up on a summit with it rather than it sitting on my shelf!

Topic: 11924 Message: 11988

There's a couple of "improvements" I probably should figure out:
And can't.

When I reply to a post, the edit window does not show any history.
But once it is posted to the group, I see the entire previous post has been included.
How do I edit that history down to avoid clutter and better show what I am responding to?

I'd like to turn back on the daily digests via email since reading from this web interface is so silly.
Clicking "Manage My Groups" in the left column gives a promising page, shows the correct email address and shows daily digests are turned on. But they never show up. Do I need to also turn on digests somewhere else?

Er, flameproof suit donned. How important is it to rely on the web interface when you can have the list's emails sent directly to you. Clog an inbox? No. Set up a folder for the group and set up a filter that ships the AT_Sprint emails to the folder as they come in. Then browse that folder to your heart's content at your leisure. And I'll bet your email client will organize the emails in the folder by thread. Problem solved? No muss, no fuss, no dealing with overhauled web interfaces. Or at least you deal with it less frequently. Just askin'. ;-)

Good idea. I've alway wanted to make wireless paddle, but I was going to use the little 900 MHz RF transmitter/receiver modules or use a processor with a built in transmitter.

Instead of building this into the rig, it might be more usefull as an accessory. Basically, there needs to be a sender module and a receiver module.

There are a couple of ways this can be done.

1, The paddle sends a code for dot or dash to the receiver, which then decodes the signal and activates the approperate paddle input on the rig. This would work for any rig with a built in keyer.

2, The keyer is located at the paddle and a simple on/off keying signal is sent to the rig. Now it can be used with any rig, built in keyer or not. Having all the keyer controls located at the paddle instead of over at the rig might be an advantage too.

Method #1 would require the receiver to have it's own power source. Method #2 the power could to the receiver could be placed on the sleeve, normally used as the dash input. In either case, the sender would need power, this could be a simple coin cell or two.

I'm leaning towards method #1 as it is the simplest way to implement it and with a chip which only has to encode the dot and dash signal, it should be possible to add a touch switch function too.

Okay, great another project to think about - thanks :)

Years ago there was a project in either QST or 73 that did that very thing: Separate xmit/rcv modules for a CW keyer. That was something I was "going to do" but never did.

Good idea. I've alway wanted to make wireless paddle, but I was going to use the little 900 MHz RF transmitter/receiver modules or use a processor with a built in transmitter.

Instead of building this into the rig, it might be more usefull as an accessory. Basically, there needs to be a sender module and a receiver module.

There are a couple of ways this can be done.

1, The paddle sends a code for dot or dash to the receiver, which then decodes the signal and activates the approperate paddle input on the rig. This would work for any rig with a built in keyer.

2, The keyer is located at the paddle and a simple on/off keying signal is sent to the rig. Now it can be used with any rig, built in keyer or not. Having all the keyer controls located at the paddle instead of over at the rig might be an advantage too.

Method #1 would require the receiver to have it's own power source. Method #2 the power could to the receiver could be placed on the sleeve, normally used as the dash input. In either case, the sender would need power, this could be a simple coin cell or two.

I'm leaning towards method #1 as it is the simplest way to implement it and with a chip which only has to encode the dot and dash signal, it should be possible to add a touch switch function too.

Okay, great another project to think about - thanks :)

Bluetooth would probably be more expensive, use more power (even Bluetooth LE), and there's a possibility of RF interference.

However, I've always thought it would be nice to Bluetooth the audio to my phone/tablet/computer, have it decode the CW, and then convert keyboard inputs (maybe even voice) into keyed inputs into the radio.

my aversion to it is that I rest my fingers on the paddle full time so my fingers know where it is. I can't get used to not touching it between elements.

my homebrew paddle only weighs about six grams. I attach it to either the radio or my log support, both of which would be present anyway, to support it.

I seem to remember that the QST project was fairly expensive also, ~ $100 comes to mind.

I like touch paddles and have built several of them. I do prefer some, but not all, mechanical paddles over them. With a little practice they seem natural, as do finger tappers. All are good.

Real radios weigh less than a pound.

I tried that once - used a cheap bluetooth headset and wired into an ATS-3B. Was hopeing to talk to my PDA with it for PSK. It totally trashed the ATS receiver, but I did have it jammed into the Altoids tin with the rest of the rig. Might work as a well shielded external module. But I hear reports of the ATS receiver not liking cell phones near-by too. I suppose they make too much wide band noise in the HF spectrum.

Cool - they make gloves now that work with touch devices.

So not only do you buy the touch device, now you need special gloves too? But how about making touch devices that work with YOUR gloves? You know - the warm ones that you use on the summit? Not the frilly white ones that are approved for the I-phone.

I haven't needed gloves since I moved to Texas. But somewhere out there is my opposite, and he needs gloves just about ALL the time. It's that guy I am thinking about.

The variant with the keyer at the paddle generating an infrared straight key signal is what PalmPaddle does IMHO.

I bet the keyer chip modulates the IR LED directly:

http://www.palm-radio.de/english/eirlt_IR-Junker.html

And there is really nothing at the receiver side, but the receive photosensor with integrated filter, which is found in every CRT TV. The IR sensor has 3 legs, power and a digital output.

http://www.palm-radio.de/english/eirlt_IR-Sensor.html

If Steve provides a programmed chip for the keyer / transmitter, it would be trivial to homebrew the whole thing because there will be just a couple of passive parts necessary plus the IR LED and the IR sensor.

I actually experimented with the IR sensor some 20 years ago when I was at the high school. I wrote an application to analyse codes of unknown IR remotes.

Hi Steve, QRPers,

Personally I would go for the Method #2. I've used cheap 433 MHz one-way modules to build remote sensors for a weather station kit I was planning to sell (one module for TX, one for RX, around 50m coverage) and they do OOK very easily with rather current draw (but not negligible since they have no power saving features).
If you want to send "dash and dot" through it that means that you will have to implement some kind of protocol. This may add some latency to the keying...

Good idea. I've alway wanted to make wireless paddle, but I was going to use the little 900 MHz RF transmitter/receiver modules or use a processor with a built in transmitter.

Instead of building this into the rig, it might be more usefull as an accessory. Basically, there needs to be a sender module and a receiver module.

There are a couple of ways this can be done.

1, The paddle sends a code for dot or dash to the receiver, which then decodes the signal and activates the approperate paddle input on the rig. This would work for any rig with a built in keyer.

2, The keyer is located at the paddle and a simple on/off keying signal is sent to the rig. Now it can be used with any rig, built in keyer or not. Having all the keyer controls located at the paddle instead of over at the rig might be an advantage too.

Method #1 would require the receiver to have it's own power source. Method #2 the power could to the receiver could be placed on the sleeve, normally used as the dash input. In either case, the sender would need power, this could be a simple coin cell or two.

I'm leaning towards method #1 as it is the simplest way to implement it and with a chip which only has to encode the dot and dash signal, it should be possible to add a touch switch function too.

Okay, great another project to think about - thanks :)

Hey, folks:

This thread seems to show that we all have different preferences for keys.

Steve, if you really want to play around with different key designs, maybe you could let people choose their preferred style(s) when ordering (e.g. "I'd like the regular jack plus the touch keyer module" or "I'll take the IR-based version.") If that makes the kitting too annoying, I'd just ask that you leave the builder the option of sticking with a standard stereo jack.

I have noticed that effect here also. In fact any 602-based receiver (including my K1 and KX1 Elecraft rigs) go nuts with a nearby cell phone. I have a new problem with my ATT U-Verse installation. The router is in the ham shack and I have to add ferrite clamp on beads to the antenna input coax for the MTR, Tribander and KX1 rigs in order to attenuate the pulse noise.

Dave K1THP
>
>
> >However, I've always thought it would be nice to Bluetooth the audio to my phone/tablet/computer, have it decode the CW, and then convert keyboard inputs (maybe even voice) into keyed inputs into the radio.
>
> I tried that once - used a cheap bluetooth headset and wired into an ATS-3B. Was hopeing to talk to my PDA with it for PSK. It totally trashed the ATS receiver, but I did have it jammed into the Altoids tin with the rest of the rig. Might work as a well shielded external module. But I hear reports of the ATS receiver not liking cell phones near-by too. I suppose they make too much wide band noise in the HF spectrum.

I ordered a digital display and a DDS from vendors on e-bay. Used Paypal to pay. I know I received confirmation that the orders had been received. In fact, I just received the display today. I know that my account has been charged for the DDS.

But, I can't find the messages with the link to the orders by searching for "ebay" "confirm" "order."

What's the address from which confirmations of orders are sent? I'd like to give the place from whence I received the display an "excellent" rating for service.

I don't know whether this is on topic or off topic, and I know it's a stupid question, but it's relevant to the 160/80 kit which I have in my possession, so I figure it's not waaayyyy off topic.

Hi Steve and all,
After a 6-year hiatus, I'm resuming my build. I have one of the 3B's from the 'second 100 kits' series, dated 24-Sept-2007.

Should I just follow the 24-Sept manual, or are there errata or further revisions that I should be aware of? Perhaps some of you could share your 'ATS-3B lessons learned'. :-|

That would all be very helpful. Anxious to get this rig on the air. It's a classic.

Tnx&72,
John/af4ex

Be sure to completely inventory the parts before starting, it will improve the chances of finding a mistake later. Don't plug the ICs in until a voltage check has been made. Install the diodes, they aren't mentioned in the instructions.

From what I see, Steve's designs are aimed primarily at simplicity and minimal weight.

For Steve's continued simplicity of design and minimalist weight, he is probably best off continuing with the simple key jack, and allowing people to choose the key of their choice, or to add to the complexity and weight on their own. That way, everyone gets to use the BEST KEY - their favorite.... and those who want something special are free to build an additional plug-in IR receiver a touch paddle, or whatever.

Hey, folks:

This thread seems to show that we all have different preferences for keys.

Steve, if you really want to play around with different key designs, maybe you could let people choose their preferred style(s) when ordering (e.g. "I'd like the regular jack plus the touch keyer module" or "I'll take the IR-based version.") If that makes the kitting too annoying, I'd just ask that you leave the builder the option of sticking with a standard stereo jack.

Absolutely. Small, light and low current. Add too many features and you'll get a KX1.. Which I can buy right now. I want the MTR because it is smaller and works great at it is. I don't want to have to carry around batteries for an IR key. As Mike says, anything can be added later.
If it could fit in the same small size, SW listening would be a big plus, but not at the price of size increase.

I would like to be able to select either HAND KEY mode or INTERNAL KEYER mode via a software selection.

I prefer to use an external keyer with my MTR and it requires me to carry a small stereo mini plug to jack into the KEY jack to select HAND KEY mode when powering the MTR up.

The mini plug requirement just adds to one more thing to forget to bring with you on your outing (grin).

Joe:

To select Hand Key I just plug in the mono-plug which is part of my J-38 setup which I usually bring with me (I'm a very Olde Fogey who LOVES his straight key.) For me, this is the most logical way to "teach" the rig my preference. To have to go through some routine to tell the software that a straight key is being used would seem to be a very cumbersome, extra step.

Every external keyer which I've seen uses a mono plug. Of what kind of external electronic keyer speaketh thou? Or do you also use one of those high priced rigs like a KX3 which is stupid enough to look at the "ring" connection when in straight key mode so that you need to have a stereo plug at the end of your electronic keyer with nothing attached to the ring connection? I've complained to Elecraft of this stupidity with no avail. When I use a borrowed KX3, I'm forced to carry a special connector which is female mono mini jack connected ONLY to the tip end of a stereo mini plug. I had to make this special unit, because haven't found one commercially made. (I haven't really looked, because it would be soooooo very easy for Elecraft to implement what Steve does with his rigs.)

You just need a mono plug on your external keyer cable. If you want SK mode with a paddle, just power on with the dash paddle closed.

That is where the miniDSP would shine. You could easily change the bandwidth. I would have to check, how difficult is to demodulate AM though.

I received the miniDSP evaluation board yesterday. Now I have to spare couple of days somehow to verify, whether the A/D converter could actually be used to sample at the IF directly. If so, the miniDSP could do the detection, filtering, AGC and earphone amplification. Just add the front mixer and VFO and you have a complete receiver. If the A/D converter cannot be used to sample at the IF frequency (the IF frequency could be lowered if necessary), then a classic IQ SDR could be implemented, but that requires two front end mixers and a quadrature VFO, which is usually achieved by running an oscillator at 4x VFO frequency and dividing.

So, there have surfaced a lot of different wishes for the next generation of MTR, some more wildly creative than others. No offence, but one can not stop thinking there seems to be those who see this as some kind of theoretical exercise and those who express their opinion based on actual experience. Between those who have activated one or two SOTA:e, or none at all, and those who have activated 10, 25 or more SOTA.s. Between those who have walked a few meter from their cars and those who have trecked hours, if not days, to reach the summit far away from any possibility to recharge their batteries. Between those who just want a new nice little toy in the home shack and those who actually intend to use it in the bush for what it is supposed to be used for in the first place.

The latter group knows that the battery in most cases will weight more than any MTR and probably will be bigger and perhaps even more expensive. 10 fresh Enelope NiHm batteris of 2500 mAh will last you 8 or 9 SOTA activations lasting 30 to 45 minutes each of intensive CW work. This leavs nothing left to do any casual QSO:s along the trail. Making the size and weight of the new MTR as small as possible ought thus NOT be the number one priority. Of higher priority is power consumption to keep the weight of the battery as low as possible. Keeping the current below 50 mA on receive and below 600 mA on transmit is and should be the number one priority!

Some have talked about having place for the batteries in same case as the MTR. Okay, and what about those who actually intend to walk the Appalachian Trail in the US or Kungsleden in Sweden? Those who need more like 5000 mAh? What about them?

Because of power consumption we are not going to get world-class receiver performance. We are more or less stuck with the SA612 in the first mixer and what it can deliver in dynamic range. Anything better would rise the power consumption above 50 mA. Adding to this a decent bandwidth of about 600 Hz we are left with a receiver that is far from the best, but has a performance that is ENOUGH to successfully activate a SOTA and make some occasional qso:s along the trail.

What Steven think is best after the first mixer is up to him and his ambitions, we will most likely follow whatever he chooses to do! Analog or miniDSP is up to him as long as the receive current stays below 50 mA!

A display showing frequency and battery voltage is a good thing. A tiny one is better than no display at all. Frequency to know where you are, and battery voltage not to ruin your expensive batteries. Batteries that in some cases even might be more expensive than your precious little MTR!

W0EA have shown that there actually exist counters that can act as frequency tuner and that could be side-mounted like the volume control on the ATS-4. The argument against a rotary frequency control because of a protruding knob is thus no longer valid. From now on it is just a matter of the willingness to implement it.

From the responses it is obvious that Europeans work under different conditions than the Americans. Europeans favour lower bands, Americans favour higher bands. Both seems to be satisfied with two or three bands. So, let?s choose any band you like between 80 and 15 meters! While you build the rig you choose the bands. Necessary parts are included in the kit!

And again, if you haven?t noticed, I have activated 306 SMFF:s and 60 SOTA:s and I still think that the ATS-4b is the best there is! If Steven want to prove me wrong I would be more than happy to accept whatever he would come up with!

At this point it IS a theoretical exercise. If all we focused on was receive current then the discussion wouldn't have brought up any of the interesting ideas that might inspire new circuits, radios, and products. I think we'd all agree on the importance of low current draw, and we take it for granted that Steve keeps that high on the priority list.

Those who actually plan on walking the AT will of course bring a larger battery pack along with them, and probably some sort of solar panel to keep it charged up. Something modern -like a 3 cell 11.1v 5000mah LiPoly. It's the size of two granola bars and weighs 380 grams.

There is something to be said though for a rig with internal battery, touch keyer, ant tuner all in one box for the 75% of users who don't go much beyond a few miles from our cars.

Lets keep it theoretical What could be done to improve on the SA612? Are we really "stuck" with it? What if cost was of no concern?
~Steve

Between those who have walked a few meter from their cars and those who have trecked hours, if not days, to reach the summit far away from any possibility to recharge their batteries. Between those who just want a new nice little toy in the home shack and those who actually intend to use it in the bush for what it is supposed to be used for in the first place.
The latter group knows that the battery in most cases will weight more than any MTR and probably will be bigger and perhaps even more expensive. 10 fresh Enelope NiHm batteris of 2500 mAh will last you 8 or 9 SOTA activations lasting 30 to 45 minutes each of intensive CW work. This leavs nothing left to do any casual QSO:s along the trail. Making the size and weight of the new MTR as small as possible ought thus NOT be the number one priority. Of higher priority is power consumption to keep the weight of the battery as low as possible. Keeping the current below 50 mA on receive and below 600 mA on transmit is and should be the number one priority!
Some have talked about having place for the batteries in same case as the MTR. Okay, and what about those who actually intend to walk the Appalachian Trail in the US or Kungsleden in Sweden? Those who need more like 5000 mAh? What about them?
Because of power consumption we are not going to get world-class receiver performance. We are more or less stuck with the SA612 in the first mixer and what it can deliver in dynamic range. Anything better would rise the power consumption above 50 mA. Adding to this a decent bandwidth of about 600 Hz we are left with a receiver that is far from the best, but has a performance that is ENOUGH to successfully activate a SOTA and make some occasional qso:s along the trail.

What Steven think is best after the first mixer is up to him and his ambitions, we will most likely follow whatever he chooses to do! Analog or miniDSP is up to him as long as the receive current stays below 50 mA!
A display showing frequency and battery voltage is a good thing. A tiny one is better than no display at all. Frequency to know where you are, and battery voltage not to ruin your expensive batteries. Batteries that in some cases even might be more expensive than your precious little MTR!
W0EA have shown that there actually exist counters that can act as frequency tuner and that could be side-mounted like the volume control on the ATS-4. The argument against a rotary frequency control because of a protruding knob is thus no longer valid. From now on it is just a matter of the willingness to implement it.
From the responses it is obvious that Europeans work under different conditions than the Americans. Europeans favour lower bands, Americans favour higher bands. Both seems to be satisfied with two or three bands. So, let´s choose any band you like between 80 and 15 meters! While you build the rig you choose the bands. Necessary parts are included in the kit!
And again, if you haven´t noticed, I have activated 306 SMFF:s and 60 SOTA:s and I still think that the ATS-4b is the best there is! If Steven want to prove me wrong I would be more than happy to accept whatever he would come up with!

A while back, I seem to remember Steve making a single band rig that had a built in manual tuner for his AT hike. At least for backpacking or SOTA efforts, I would like to see something like that. Pretty much everything self contained. At least the rig and a tuner. A 9v battery plug could sit on the outside attached to the case. Radio shack has a AA case with a 9v attachment on it for added time on the air.

You could order different bands. Or if it doesn't take up anymore space, dual band. A straight key on the lid would be cool with the option of plugging in a paddle to bypass. Make these for any band that is reasonable. I'd kill, (or maybe harm), for 10 or 6 meters. But I guess that would be prohibitive. But I'm sure whatever the price, it would sell out overnight.
Oh yeah, make a lot of 'em. A hell of a lot of 'em.

de n5vwn ats3a owner.

Hello,

I think the SA612 works fine. The miniDSP, that would be great and a major improvement.
No battery inside, that should be up to the user. We all like using different ones.
I don't think the MTR needs new "internal" anything. The current form factor is great.
Truth is, there isn't much to be improved upon, it's a great radio.
The receive current draw should be kept as low as possible, that's a given.
We should all be happy to get one extra band, which for me would mean being able to operate on contest days on 30m. Add DSP and that's all I could possibly ask for.. Well, SWL maybe ;-)

We should all be happy to get one extra band, which for me would mean being able to operate on contest days on 30m. Add DSP and that's all I could possibly ask for.. Well, SWL maybe ;-)

Adding a 3d band doesn't impact the cost or size too much, so I think that will be a given. I might kick up the DDS clock speed to 50 MHz so 17M could be added to the mix.

SWL capability is a bit more complicated. There are a couple of issue there, one is the crystal IF fitler is a bit narrow for voice and making it adjustable bandwidth degrades it's performance where you really need it - CW reception. The other is the BFO frequency really needs to be reset also.

However, it just occured to me there is a spare output on the 1st mixer. This could be routed to a spare input on the miniDSP chip and the VFO reset to make this a Direct Conversion receiver. Humm, might not be enough gain without an intermediate audio amp, but then for SWL might not need it. Would be worth a try.

I think I'll stick to the single LED digit for display. Even a mini chip-on-glass 2x16 LCD takes up too much space.

For packaging, I think I'll make the case as low profile as possible. If you take a standard 8.5" x 11" clip board and cut it in half, you can mount the rig and paddle at the top of the board and have enough room for some paper to log on below it. Use rubber bands to hold stuff to the board.

There is just enough surface area to hold the clip board on your lap, making a convenient operating table while sitting on a rock or a log.

> to the board.

That was exactly my thinking!
As to SWL, even if it covered only 31 and 41m, would be great. I think there is also 19,22? Not sure.. AM might not be necessary, as one can tune on one sideband, but the sound would be better with it.
The thinner case would be great, but the same gauge as the last one!
The single LED display works fine, no need to change it.

Thanks again for your work! I can't wait to see it.. Might even get two!

Gil.

12043. DBDC (Dual Band 160/80) Clarification Needed

Yahoo group: AT_Sprint (2012 — 2013)

I'm wiring the flat cable to the LCD. The instructions says not to connect pins 1,2, and 3 until the voltage check is done. So, pins 4,5, and 6 would be wired using the next three wires of this six wire group, at least that seems logical. Then, the instructions say pins 6, 7, 8, and 9 are not used. The photo inset shows pins one through six and pins 11 through 14 as connected, with 7,8,9, and 10 not used.

What is the correct way?

12044. MTR Touch Paddle

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-07 16:45:42 UTC
From: John - VE4JWC
Topic: 12044 Message: 12044

Hey out there,

Anyone experiment with this simple touch paddle design using a
darlington pair?
http://www.qsl.net/w6dps/paddle.html

Stealing the built in paddle contacts from W0EA's blog post
http://www.w0ea.us/search?updated-max=2013-08-19T06:16:00-07:00&max-results=7

I did mine up similarly with Brass acorn nuts, wired up a couple of
darlington pairs and away it went.
It works FB when running off a wall wart plugged in at home, but i get
nothing when running off a 9v battery outside.

Suggestions? Maybe someone has a better circuit that would fit in the
MTR for this, but I really like the minimal concept of the D Pair.

Well said sir. Very well said. Steve designs tiny lightweight radios. And for a purpose. That purpose is to carry radio long distances. All that extra stuff is just that - STUFF. Not necessary. If someone needs more, there are other choices.

I am still waiting and hoping for a re-release of the ATS-4. I will be wanting to get one for the 5 y/o grandson.... we can build it together when he gets a little older. He just bought me a sign for my workbench. It says Grandpa's repair shop. Toys repaired here.

Next summer I am thinking we will start off with an oatmeal box crystal set, just like the old days.

Subject: Re: [AT_Sprint] Re: Next generation of the MTR...

So, there have surfaced a lot of different wishes for the next generation of MTR, some more wildly creative than others. No offence, but one can not stop thinking there seems to be those who see this as some kind of theoretical exercise and those who express their opinion based on actual experience. Between those who have activated one or two SOTA:e, or none at all, and those who have activated 10, 25 or more SOTA.s. Between those who have walked a few meter from their cars and those who have trecked hours, if not days, to reach the summit far away from any possibility to recharge their batteries. Between those who just want a new nice little toy in the home shack and those who actually intend to use it in the bush for what it is supposed to be used for in the first place.
The latter group knows that the battery in most cases will weight more than any MTR and probably will be bigger and perhaps even more expensive. 10 fresh Enelope NiHm batteris of 2500 mAh will last you 8 or 9 SOTA activations lasting 30 to 45 minutes each of intensive CW work. This leavs nothing left to do any casual QSO:s along the trail. Making the size and weight of the new MTR as small as possible ought thus NOT be the number one priority. Of higher priority is power consumption to keep the weight of the battery as low as possible. Keeping the current below 50 mA on receive and below 600 mA on transmit is and should be the number one priority!
Some have talked about having place for the batteries in same case as the MTR. Okay, and what about those who actually intend to walk the Appalachian

Trail in the US or Kungsleden in Sweden? Those who need more like 5000 mAh? What about them?
Because of power consumption we are not going to get world-class receiver performance. We are more or less stuck with the SA612 in the first mixer and what it can deliver in dynamic range. Anything better would rise the power consumption above 50 mA. Adding to this a decent bandwidth of about 600 Hz we are left with a receiver that is far from the best, but has a performance that is ENOUGH to successfully activate a SOTA and make some occasional qso:s along the trail.

12047. Re: MTR Touch Paddle

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-08 15:24:15 UTC
From: Reed White
Topic: 12044 Message: 12047

John, you asked for a circuit-design suggestion.

It probably works fine in the home with a wall-wart because your body is picking up enough 60Hz to turn on the Darlington pair. There is no 60 Hz in the woods.

Perhaps you could try a PNP transistor for the first transistors with the emitter flipped up to the control lines, and with the PNP's collector feeding the NPN's base. The second NPN transistors would remain the same. You might need a high-ohm (10K to 1M) pull-down resistor from the NPN transistor's base to the effective ground line if the circuit is overly sensitive. You might also want capacitors in the circuit if it is too sensitive to RF ...

This design might work better with a battery because if you hold the rig with your left hand and do code with your right, there would be a high resistance path to ground through your body that would turn on the PNP (and hence NPN) transistors.

Disclaimer: I did not actually test this suggestion.

Yep, that's the reason, no AC pick up to trigger it. I belive I've seen touch switch designs which used an oscillator to provide the AC signal. The finger is used to capacitively couple the AC signal to the detector.

Using skin resistance by it's self isn't very reliable.

Is this the miniDSP? http://www.ti.com/product/tlv320aic3206
Wow, very cool. Designed for stereo audio processing, two channels sampling at up to 192 KHz.
Sucks 3 or 4 mW. Drives headphones. Could this be the basis for a low powered software defined radio?

Crystal filtering up front to knock out strong adjacent signals is simple and probably better for CW,

but the option of adapting this to SDR would be very cool. Oscillator would need to run at 4x, so either
SDR is restricted to use at low frequencies or perhaps try an Si514 powered from a clean switcher.

Fella's

With all the chatter here on the reflector in the last few days, regarding new implantations or up-grades to the " MTR " Series of radio's ...

Someone post a few days back a link to " W0E's " Blog ... Which I looked over with MUCH interest, LOTS goin' on there ...

One thing I WAS impressed with, that has always intrigued me for many a year - Is the picture (see link below) on his website
Of his " MTR " with new Battery Option ... AND ... Touch-Paddle ...

http://www.w0ea.us/search?updated-max=2013-08-19T06:16:00-07:00&max-results=7

MY QUESTION IS - Bearing In Mind, that we have differences between us Europeans & American side of things, in what we can get from suppliers or at the local hardware store - CAN SOMEONE TELL ME & PROVIDE A LINK (Perhaps) ...

What the little Chrome " Button " things are called in the picture above from W0EA's website, that he has implemented there in his design to make a " Touch Paddle " ?

I HAVE seen this very thing, many, many times on the internet over the years, but so far the NAME (Product Name perhaps) of the little " Button-thingys " there alludes me ... If I can find either a supplier here in the UK... or better still, some kind Radio Ham from somewhere who may be able to help sending me a half dozen (payment re-imburst obviously by me), that would be even better ...

But for the moment, I am just intrigued as to what these little " Buttons " are called, where one might get them (particularly in the UK) and PERHPAS if someone might upload a drawing of sorts into the files section here of the list - HOW TO MAKE a " Touch Paddle " from these very things, would be the icing-on-the-cake !...

Thanks For The Bandwidth Fella's ...

We call them "acorn nuts" - we use them at work for a project and get them
from Mutual Screw - I'm sure any supplier of hardware in the UK would have
them. Possibly called "cap nuts"...I'm sure there are other names as well.

http://www.mutualscrew.com/product/low-crown-steel-nickel-plated-2-piece-acorn-nuts-51055.
cfm?source=froogle&gclid=CI6QraT31boCFWtk7Aod_D4ALA

TJ may be using this board: I'd thought of putting one of these in my MTR
or ATS-3b: http://www.cwtouchkeyer.com/P3W.htm He can give more details
on his implementation.

I've made a test paddle just using some scrap PCB material for the paddles
along with this board and placed it temporarily (a year ago!) in a small
cardboard box: http://www.aa4ga.com/2012/05/spartan-sprint-may-2012.html

Andy! Thanks for the email - they're called "cap nuts" and should be easy
to find at the local hardware store. If you cannot find any, I will be
happy to send you a package.

Fella's

What A Wonderful Group !

" Shout Out To T.J. Campie - W0EA " .... and ALL the other so kind folks here on the list that have sent me the answers to this question in the last hour or so ! - Problem SOLVED ...

This for " me " (laugh if you like) was a thing that has had me stumped for YEARS ! - I have seen those " Cap - Acorn Nuts " many a time, particularly with folks like Hans - W1JSB and his creations when implemented as some form of Keyer Paddles, but I had NEVER known the proper name ...

2 Folks Already (T.J Himself too !) have sent me links to both a US Vendor & a British Vendor for these very things, so I have to say - THANKYOU Fella's for all you have done tonight ...

I have learned something today,... all that remains now is to try & track down some kind of diagram to help with the building of such a " Touch Keyer " that might possibly implement these very things - I am NOT so good at figuring out photographs that show this sort of thing unfortunately...

The 2nd Part Of The Search Continues ...

Stay Tuned !

Hi Steve, folks,

First, the MTR perfectly fulfilling my portable needs (except for 10 or 12m possible coverage but I understand the restriction) I am not planning to buy any "MTR/ATS" anytime soon.
Something like the ATS-4 could be better, but the added features will make it above the budget I can afford for my small portable operations.
I agree a KX3 would be the dream transceiver to me. However, for its price I prefer to improve my home stations aerials.
Given that, all what I am saying here below is "free talk" and the expression of my very own opinion...

I agree with Gil that the ATS/MTR receiver does not need improvements :
- No need for better strong signal handling. The MTR purpose is SOTA-like operation or "back-packing" portable. It should not be connected to antennas with gain.
- No need for more sensitivity. On the target bands (80->15m), the noise is often limiting the weaker signal you can hear. Even more, with 5W output, you will not be able to work the weaker signal you may hear.
- No need for better IF filtering. 600Hz is the perfect choice for both "tuning the band" and having a QSO not being disturbed by close (but not too) signals. This is not a contest rig.
Except by totally changing the architecture, any improvement would be to the detriment of other important aspects : current draw, circuit size, cost...
Steve may want to explore other designs, but I have no competence to give advices about that.

About the SWL feature, this may be interesting but the additional circuitry will make the whole RX bigger and more expensive. Another important point is that as it is designed, the MTR tuning method (UP/DWN and DFE) is not well adapted to SWLing. Having a simple and lightweight BCL with AM/FM coverage in your backpack would be more pertinent to me.

An audio DSP feature is something I think useful and I understand one would like to explore this technology. Here I have a TI LaunchPad Stellaris (Cortex M4) that I wanted to use to do I/Q demodulation and light DSP like processing. However I currently have no spare time for this project.
Adding a DSP audio filter would help fighting against the noise and "weak" close-by QRMing signals.

73,
Yan.

Yannick DEVOS - XV4Y
http://xv4y.radioclub.asia/
http://varc.radioclub.asia/

> We should all be happy to get one extra band, which for me would mean being able to operate on contest days on 30m. Add DSP and that's all I could possibly ask for.. Well, SWL maybe ;-)
>
> Adding a 3d band doesn't impact the cost or size too much, so I think that will be a given. I might kick up the DDS clock speed to 50 MHz so 17M could be added to the mix.
>
> SWL capability is a bit more complicated. There are a couple of issue there, one is the crystal IF fitler is a bit narrow for voice and making it adjustable bandwidth degrades it's performance where you really need it - CW reception. The other is the BFO frequency really needs to be reset also.
>
> However, it just occured to me there is a spare output on the 1st mixer. This could be routed to a spare input on the miniDSP chip and the VFO reset to make this a Direct Conversion receiver. Humm, might not be enough gain without an intermediate audio amp, but then for SWL might not need it. Would be worth a try.
>
> I think I'll stick to the single LED digit for display. Even a mini chip-on-glass 2x16 LCD takes up too much space.
>
> For packaging, I think I'll make the case as low profile as possible. If you take a standard 8.5" x 11" clip board and cut it in half, you can mount the rig and paddle at the top of the board and have enough room for some paper to log on below it. Use rubber bands to hold stuff to the board.
>
> There is just enough surface area to hold the clip board on your lap, making a convenient operating table while sitting on a rock or a log.

Here's an idea for you, Steve. Build it small, light, and with minimal features, BUT have the capability to expand it. I'm thinking along the lines of Arduino. For example, have some GPIO pins where someone could add a larger display. Or another direction would be to have the radio operate stand-alone, but build the form factor with IO pins that would allow it to act as an Arduino shield. That would allow people to go crazy with expansion/customization.

I'm all for that. Patterned on the MTR size and power wise, with 38 pin MSP430 (or Tiva?) Could be tough to find room for 10 more traces and through hole pads. Perhaps the holes could be drilled in under the four switches, put mylar or teflon tape down under the switches if you care about ever using the expanded IO. If the miniDSP gets in there, would also be nice to have a way to get a daughterboard to talk to the two miniDSP inputs and to the RF in. So an MTR sized board for the basic radio, and a second MTR sized board that mounts under it for user hacks. Could be many different such secondary boards built. Maybe autostuff all surface mount parts on one side of the basic radio in enough volume to meet demand for those that want a partially assembled radio. I got a rough quote of $20/board to do such an autostuff from a local assembly house. KE7ER

12064. MBDC transformer winding

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-10 16:03:29 UTC
From: Hinds, Don
Topic: 12064 Message: 12064

I'm just about finished with assembly and have started fitting the case but I am a little confused about winding T1. In the toroid list, it is described as six turns. In the detail instructions, it is listed as eight turns. In the picture, the toroid seems to only have five turns. It probably isn't critical, but I wanted to check. I would hate having to pull it off and re-wind it.

Can anybody shed some light on my confusion?

It doesn't really matter. I think I settled on 6 turns in the last rev of the manual, but if you have 8, that will work just as well.

The picture is just to illustrate how it's wound and is generic in that I use that same picture every time I have to show how to wind a core like that.

From: <wlinn.linn@...>
Topic: 12067 Message: 12067

Steve's done it again. put my MBDC on the air yesterday and since then, have logged several QSO'S including one on 160 meters. Steady as a rock and easy to set up.

i do have a question, however. I may be missunderstanding how to work the RIT but mine seems to work differently than any other I've used. A RIT is supposed to change only the receive frequency, right? When I turn on My RIT and attempt to adjust the receive frequency, the transmit frequency is also changed. So, if I want to transmit on 3.560 I set the LCD to read 3.560.600 then, turn on the RIT and adjust it to -600. This puts me smack dab on 3.560. However, if I want to change the receiver frrequency, the xmit changes also. What am I missing.

Oh Man, I can't belive I screwed that up! I got to stop working on these things so late at night :(

It appers that the transmit frequency is still tuning with the receive frequency when RIT is turned on. Then when you transmit, it transmits on the RIT frequency and then switches to what should have been the transmit frequency for receive - backwards of what it should be doing.

That's got to be confusing.

Okay, there is only one way to make this right and that is to send everyone a new processor. I'll do that as soon as possible, but I will have to buy a new batch of chips and some mailers, so it will take a couple of weeks to get them all out. Once you get the new chip, you can send the original back if you like, as I can recyle them.

One problem is I didn't save all the mailing address label files I made, or all the envelopes checks came in. I'll try to figure it all out. I should however have all the email address, so I'll do my best to figure it out.

Nuts! I did that last night, and was confused too. The picture shows 4 full turns, and the instructions said eight, so I thought each wire was counted twice (2 X 4 = 8). Oh well, won't be the first torroid I've redone.

Thanks Steve, and sorry it turned out not an easy fix for your sake. I'm getting good comments on the signal, one guy running a K3 with a pan-adapter said the signal was the cleanest he's seen since he's been using it. So, it is a winner!

I'll dig up your email address and send you my mailing address via your personal email.

Regards,
Bill - W7WEL

☐ Oh Man, I can't belive I screwed that up! I got to stop working on these things so late at night :(

It appers that the transmit frequency is still tuning with the receive frequency when RIT is turned on. Then when you transmit, it transmits on the RIT frequency and then switches to what should have been the transmit frequency for receive - backwards of what it should be doing.

That's got to be confusing.

Okay, there is only one way to make this right and that is to send everyone a new processor. I'll do that as soon as possible, but I will have to buy a new batch of chips and some mailers, so it will take a couple of weeks to get them all out. Once you get the new chip, you can send the original back if you like, as I can recyle them.

One problem is I didn't save all the mailing address label files I made, or all the envelopes checks came in. I'll try to figure it all out. I should however have all the email address, so I'll do my best to figure it out.

Steve KD1JV

i do have a question, however. I may be missunderstanding how to work the RIT but mine seems to work differently than any other I've used. A RIT is supposed to change only the receive frequency, right? When I turn on My RIT and attempt to adjust the receive frequency, the transmit frequency is also changed. So, if I want to transmit on 3.560 I set the LCD to read 3.560.600 then, turn on the RIT and adjust it to -600. This puts me smack dab on 3.560. However, if I want to change the receiver frrequency, the xmit changes also. What am I missing.

After thinking about this, I might have jumped the gun. The "fix" maybe as simple as re-writting the instructions. For what I implented is XIT, not RIT. Which might actually be easier to use.

The way it works now as XIT:

As your tuning UP in freqeuncy, you hear a station and the beat note is decending, indicating your tuning in from below thier frequency.

o. When you get to the nominal 600-700 Hz note, active RIT. This will set your receive frequency.

o. Now continue to tune UP until you get a zero beat. Now the transmit frequency will match the other stations.

o. Tap the paddle and the receive frequecy will be set to where you were when RIT was activted. Any tuning now will affect the transmit frequency, so it's not advised to so.

If you tune past the stations zero beat and the tone is accending, you would need to tune down after activting RIT to match the stations frequency.

What do you all think of the above method? The only problem I see with it is once set, you can't tweak the Rx frequency.

I aready order the new chips and fixed the program to work as it should have (I had a true / false flag test backwards, duhh) so, I guess I'll send out new processors anyway. But I might add this XIT mode back in as an option. There are advantages to both methods...

Hi Steve

Given the pressure we all put you under to get our new toys out the door as fast as possible, it's remarkable and a tribute to your excellent engineering skills that the final products contain few if any errors.

Speaking for myself, whilst I can see that XIT would enable one to have QSOs, we would lose the traditional function of RIT - chasing a drifting signal - and also lose the invaluable facility for a DC receiver of being able to tune in either side-band depending on QRM. So sorry Steve, my vote is for a 'proper' RIT implementation.

Keep smiling

I thimk the RIT is what most people use and understand.

How far off can the RIT be? I have an older rig with the RIT span only about 2 KHz, which is often not enough for DXpeditions. If I want to work these folks, I need to hook up a 2nd receiver, an antenna T/R switch, and be careful NOT to transmit before the T/R switch actually gets engaged.

You're a jewel.

Gang,
I just got my mbdc in the box and discovered the RIT problem when trying to answer a CQ. On a quick read the work around seems awkward but perhaps new chips are on the way. In my brief experience with the rig I was wishing it would retain the code speed after power down, mine goes back to 20 wpm after power down. I would also prefer that it remembered the last operating frequency. Neither are show stoppers, but maybe something to think about in the next run.
I had fun building the rig. Only problems were installing my last resistor (R32) without double checking it and ended up with a 220k rather than a 22k. You don't have filter switch when that happens. I also had trouble recognizing two bad solder joints on the display. You get an erratic display when that happens - I was afraid I had toasted the processor. I am hearing more of a pop than I'm used to when the qsk switches back to receive - I wonder if a component tweak might fix that?
Thanks Steve for another fun little rig. /John W7SWB

Again, it doesn't matter. 6 is okay and 8 isn't going to hurt. Heck, spit the difference and use 7 :)

Hi Steve,

Given that this kind of thing happens from time to time, I wonder if you would consider for future rigs (hopefully quite a number!) providing for firmware updates in the field through an outboard box. You might be able to create a kit for the box, and a connector on the rig to do the load to the processor. The box would have a serial connector (USB probably) for connection to the PC. A chunk of software would have to run on the PC to supervise the transfer.

What do you think?

From: Blinn
Topic: 12082 Message: 12082

Someone mentioned popping noise in the speaker as the rig is keyed on and off. Mine is so loud that I have to resort to turning the volume down to its lowest point. Of course this makes QSK unusable. I'm sure that Steve or some other guru can guide us through a fix. With the RIT fixed and the popping reduced to a tolerable level, this rig will be among the best out there, including factory made stuff.

I only recently used a SK on my unit also noticed the problem.

I belive this is caused by the mixer, which is producing a DC output when transmitting. Although the QSK switch removes most the transmitted signal from the input to the mixer, some gets through. Not enough to hurt anything, but enough to make a bit of a spike when coming out of transmit.

When using the paddle, there is enough of a delay before the mute is disabled that most of that spike has rippled through the various stages. If one or both of the bandpass filters are selected, that also helps reduce the thump.

But apparently when using a Straight Key, I didn't allow enough of a delay between key up and and un-muting, hence the big thump.

The short term fix will be to increase the delay between key up and un-muting in software. I think long term the fix will be to disable the mixer with it's enable pin when transmitting. Unfortunetly, that pin has the opposite "sense" (low vs high) from the Mute control so an inverter has to be added.

But there is one already, the auxilery mute output mosfet. One would have to isolate the enable pin on the 74HC4053 (pin 6, the simplest way of doing that would be to bend the pin up so it doesn't go into the socket) and add a pull up resistor to the +5. (pretty much any value will do, say 1K to 100K) I haven't tried this yet, but I think it would help a lot.

I don't have to re-invent the wheel, there are inexpensive ISP (In Circuit Programmers) available for the Atmel AVR chips. Spark Fun is one place to get one. Anyone playing with the Ardinu likely has one already.

However, I didn't add a convenient row of pads for ISP header pins to the board. Kinda slipped my mind. It would be easy enough to add a connector though, it's only 5 pins you'd need to jumper over to.

I might as well put the source and hex files in the MBDC folder for anyone who can reflash their processor and/or wants to try and figure out my source code and make changes or add features.

12089. MBDC thump fix

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-14 16:35:37 UTC
From: Steven Weber
Topic: 12089 Message: 12089

I finally tracked down the cause of the audio thump coming out of transmit and found a fix. Unfortunetly, it's a hardware fix, not a software one but it's not too bad.

The "thump" is caused when the QSK switch is turned back on. Since there is no thump if the input coupling cap is disconnected from the PA (by putting the slide switch in the external receiver antenna position), a charge must be building up on the cap which gets dumped into the mixer when the QSK switch turns back on. Because of all the gain after the mixer, it doesn't take much of a glitch there to end up as a pretty loud thump in the output. Anyone remember the famed 38 special rig with it's impossible to tame thump?

Therefore, the fix is to first turn on the QSK switch, then un-mute the audio a few milliseconds later once the thump glitch has propagated throught the ampifiers. Ideally, I'd have an I/O port to control the QSK switch and audio mute switch seperately, but I don't. So, we have to do it the hard way.

The "FIX" is to add a resistor and diode to the mute control line going to the 4066 control input.

The resistor in combination with the 0.1 ufd cap already on that line form a delay to turn the audio mute on a few milliseconds after the QSK switch turns on. The diode is across the resistor to eliminate that delay so the audio will be muted right away on key down.

Two cuts have to be made to the track going to the 4066 and 2N7000 gate and a jumper installed.

The value of the resistor isn't overly critical, anything from 220 K to 1 Meg will work. I'll supply these parts when I send everyone a new processor. I'll also make an addendum showing the mod as a seperate file, but I will also add it to the manual. Hopefully I'll have that ready later tonight.

So far I've had a few requests to make changes to the firmware. Before I start sending out new processors, I wonder if there are any other changes you might want, assuming I have room for them in the program memory - which is fairly close to full so we can't get too carried away, hi.

Suggestions summited so far are:

1, allow transmitting below 500 kHz so the rig can be used on the new 600 meter MF band if and when it eventually gets allocated for general use.

I will try to make that a programmable option so that those who do not want to transmit there won't have to worry about accidently doing so and risk damage to the PA.

2, store the current code speed so you don't have to reset it everytime you turn on the rig.

This I can do.

3, store the current frequency so it comes back to that frequency when turning on the rig.

This I'd rather not do. The EEPROM has a finite number of writes, 100,000 give or take a few. Since we don't know when your about to turn the rig off, the current frequency would have to be stored often. That would use up our 100K writes pretty quickly.

Maybe I can make that a manual operation so you can store a start up frequency if you have a local net or something you want the rig to power up on.

I'm also thinking of allowing you to choose which bands the rig can transmit on. Doing this would replace the default bands selections of 160 and 80, not add to it. You would of course have to change the transmit filters to match the new band or bands.

Let me know what you think and I'll go check to see how much memory I have left to make these changes. And if anyone can reflash the processor on thier own and could test the firmware for me to make sure I didn't mess anything up, that would be great!

Hi Steve, This has been covered maybe?? Would it be possible to let it remember where the rit or xit was left? not necessary when power down, but during qso, or operating time on, it would be handy to use rit.. tune up... drop back to tx freq, hit rit be back where it was left... tune a bit more while still on rit... drop back to the xmit freq, then recheck the rit freq where it was left.
Thank you, great radio!!

Have a great day,

Hi Steve and Group,
I have my MBDC up and running in a temporary PCB enclosure, with around 5 watts out on both bands.
Having managed a few QSO's with good reports by calling stations using the XIT procedure described and confusing a station and myself by trying to tweak the receive frequency mid QSO... bring on the new processor.
With regards changes to the firmware, store of the current code speed would be good and the chance a 500 kcs output great as I am xtal controlled on that band (472 KHz) at present.
Thanks Steve for another great project.

Steve,

When the design was first announced, you mentioned that it would also work on higher bands. Would it be possible to add support for 40m and 30m to the software?

Yes, I'm trying to figure out how to do that right now. I've only about 300 bytes left to work with to add a routine which would allow you to select which bands to use. At about 2 AM this morning I decided I wasn't making any progress and had better call it quits before I started making serious mistakes, hi.

My original reasoning for picking 160 and 80 as the "default" bands was two fold. One, these are neglected bands in the kit community and two, thier usually not so busy most of the time that a DC receiver with fairly wide bandwidth isn't a big problem.

40 is usually active enough that using a DC receiver can be a trying experiance and the same goes for 20. 30 probably isn't too bad. Anyway, most of you guys have a shelf full of rigs to work 40 and 30 which was another reason to focus on the "top" bands.

But what the heck, any band up to 10M is possible with this DDS, so why not? However, one might have stability problems with the PA above 20 meters. I've found it to be very touchy to the filter and lead lengths from the PA to the filter at high frequencies. You might need to buy a fist full of BS170's if you try.

In other news, I have it remembering the code speed you selected and you can store a frequency for each band to use as the power on frequency. The transmitter is now automatically enabled when tuned below 500 kHz, so be a bit careful if you have a key or paddle plugged in and you tune down below the AM BC band!

Hi Steve, folks,

Hans G0UPL is using a similar transmitter design for its Ultimate 2/3 QRSS beacons. Up to 20m, PA efficiency is good and the duty cycle DDS setting is stable.
On the upper bands, power out is dropping and the "blue trimmer" duty cycle DDS setting starts to be touchy. At 28 MHz or so, you can make it work but it will not always do for long and with a cold start the "blue trimmer" setting is always wrong.

Hi,

As I am planning to use the MDBC mainly for receiving, the only software change I would "need" is the ability to select a startup frequency. In fact I would like it to start on the BBC Singapore frequency so my father in law can listen to his favorite program in the morning.

One way to do it is to just select a memory channel for startup frequency. The K5BCQ Si570 controller I use with my Bitx transceiver does it this way. It allows you to set any F, change it in a snap, and does not use much more EEPROM memory space.
I know the MDBC does not have "real memories" but pre-selected channels. I think I will be able to modify your code so to set 11 950 KHz as one of it.

One more feature that can be useful (but not specially for me) is the ability to change the delay for the beacon mode. I don't know how deeply you need to change your code for that...

I must admit I like you choosing the ATMega48 as MCU. This one I am able to reprogram easily using the Arduino IDE (with some restrictions) so I can make a simplified firmware for a RX usage (no keyer/RIT but memories).
Maybe one day I will write a WSPR transmitter code for it, but I will need to have an external RTC clock source or so, and I don't see any pin left on the ATMega 48...

Hey, folks:

I wouldn't say 60 is totally useless, but it certainly isn't something I'd want for portable QRP CW. All I've found on there so far have been local SSB ragchews, most of which have centered around the novelty of using this weirdly restricted band. When I ordered my Weber tribander the other day, it didn't even occur to me to get 60m for it.

That said, 60 does seem to have some interesting propagation. If they eventually loosen up the restrictions and a few more countries adopt it, it could become pretty cool.

It appears that when you have the RIT (XIT) set in the beacon mode, then leave the beacon mode by tapping the key, the display of the RIT setting is erased. From what I can tell by listening to the signal with another receiver the RIT setting is in effect but not displayed. And I believe if you tap the encoder to display RIT it resets it to 0. So it seems when the beacon is turned off only the word "Beacon" should be erased and not the RIT setting. Hope this makes sense. 73 /John

Quite the opposite experience here!

I modified my first MTR for 60 metre operation and I couldn't be happier.

I use it regularly for SOTA operations here where it is a widely used and
very effective band.
QRP CW on the band is very effective for NVIS propagation.

Generally I use a half wave wire either lying on the ground or laced along
a fence a couple of feet off the ground to good effect.

YMMV

Okay, I think I got it all working right. I hope so as I have all of 6 bytes left!

In addition to fixing the RIT bug(s), I made several other changes so you'll have to down load a new manual to figure it out.

I deleted the SWBC band table from the band selections and replaced it with 10 user programmable locations.

You can now select which two bands you want to be able to transmit on and are then selected by the band switch.

You can store your own start up frequency for each of the two bands. These don't have to be in the same band as initally set by the band switch, but since it will be "out of band" as far as that switch position is concerned, the transmit will be disabled.

A minor detail, I moved the NO TX icon to the upper left corner location on the display.

Just as soon as I'm convinced I haven't created any new problems and fixed all the old problems, (and rewrite the manual), I'll start sending these out to you all.

Steve KD1JV

12111. MBDC working on RX

Finally have the MBDC nearing completion. Am hearing signals on both bands. I whopsed on the 4-pin ribbon cable to the display. I used lines 13,14,15 and 16 instead of 11,12,13 and 14 so no freq display and no back light. The signals I have been hearing have great audio presence, a trait of DC receivers. I forgot how good they can sound.
Tomorrow I will fix the cable errors and set up the transmit power.
Maybe even make some QSO's tomorrow evening.

Great fun building this lil rig Steve ... thanks for the design and kit. BTW I am using a Ten-Tec 43 enclosure. It all fit and I used your Dremel cutting wheel method to cut the rectangular display opening. Took 3 cutting wheels and a few minutes with a file to clean up. It looks better than anything I could have done with a nibbler. Much quicker and and a whole lot less cussin'.

Topic: 12112 Message: 12112

I finished the enclosure and installed the boards, fixed a wiring error on the display and tried out the receiver with real antennas.
What I found was that 160 is almost unusable due to overload from WTIC AM 1080 KHz 50 KW, located on a mountain, about 10 miles LOS from my QTH. 80 meters is much better with some bleed thru from the same station. (Will removing C17 make a difference?)

Transmit is showing 2.5 Watts on 160 and just over 5 watts on 80. I will be checking turns on the 160 meter filter toroids.

I need a replacement right angle switch for the Menu function. It does not release after being pressed. Maybe Steve can include one in the envelope with the replacement firmware.

In all, it's been a fun build and doesn't look to bad either!

Thanks Steve,
When you send mine would it be possible to include a right angle pb switch in the package? My Menu switch dies after the first push and I have to remove power to reset it. It has no tactile feel or sound.

Since I moved into the woods, I no longer have a line of sight 1 KW AM station a mile away interfering with everything I do and showing up on my Scope. This a blessing in one sense, but I can no longer judge how a reciever will perform with a strong AMBC station near-by.

The best solution would be to move to a new QRH, but I suppose that is not a practical solution, hi.

Removing C17 might help by reducing the amount of gain in the audio, but it's not going to fix the cause of the problem.

Try running the rig off of battery power and see if that reduces or eliminates the problem. Using AC line operated supplies can sometimes be a problem with DC receivers.

Probably the best (practical) solution is to build a small tuned loop antenna for recieving. That should eliminate the problem and signficantly reduce the amount of noise pick up. The only disadvantage is that it is directions, so you'd need to be able to turn it.

I guess that will have to be the next project...

This my first dc receiver for 160. I built several back in the 70's and 80's based on the 40673 and the SBL-1 (big improvement). I still like the way they sound though a superhet with xtal filters is pretty hard to beat!

Hi to all in the group

I have finished my MBDC build. Its wired up in an enclosure and looks really good. I followed the testing procedure listed in the manual and found the voltages on U3(TL084), ie 9V at pin4 and 5V at pins 10&12. Once I had then placed all the ICs added power to the LCD and installed the DDS module I powered up and the LCD worked as well as the switches for the filters and menu and the encoder. When I listened with headphones all I heard was a hiss and when I turn up the volume I hear a thumping sound, ie thump,hiss,thump, hiss and so on. No audio signals are heard at all.

I wonder if anyone in this group can offer any places for me to look to start with, possibly test voltages for say U7(74HC4053) for example?

Any suggestions and or explanations welcome, thank you.

The first thing to do is find out if the DDS module is working. I had one with a bad clock osc. If you don't have a Scope or Freq counter, use another receiver with a clip lead antenna and see if you can hear the output of the DDS at or about the frequency shown on the display.

Also double check that you have T1 installed correctly.

12119. FS - Rotary encoder for ATS-3 (Miroslav's module)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-21 19:12:42 UTC
From: AB5EU
Topic: 12119 Message: 12119

Surplus to my needs as I purchased the ATS-4 specific encoder module.
The ATS-3 encoder is assembled and tested (PCB only - no enclosure) -
the LED's are not installed allowing them to be soldered at the height
of your choice.
I will include 18" 5 way ribbon cable for soldering to the interface
connector.

Full assembly/module details at: http://diy4fun.blogspot.com/
$27 plus $5 shipping CONUS only.

Email off list: AB5EU "at" wildblue.net

I suspect a bit of the super glue got into the pb switch. Are the white nylon spacers available a bit longer ... say 5/8 inches long?
Anyway it looks like I need a pair of white spacers as well as a switch. I might use a small wood or plastic dowel inserted into the spacers to give me the extra length I need.

12122. Re: [AT_Sprint] Re: Progress on MBDC firmware

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-21 21:28:06 UTC
From: Steven Weber
Topic: 12110 Message: 12122

I've continued to fiddle with the firmware all week. One last feature which was requested and was a good idea was to allow the time between message repeats in beacon mode be adjustable.

By eliminating the 12 Meter band from the band selection table and by going through the code with a fine tooth comb to eliminate redudant code and using other memory saving techniques I was able to make enough room (and some to spare) to add that feature.

So, you can now set the space between message repeats from 1 to 6 seconds in 1 second incerments. 6 seconds is as long as I can go without another counter register for the timer and I don't think anyone would want to wait longer then that. 6 seconds seems like a long time. The inital setting will be 3 seconds as it is now. The setting isn't stored in eeprom, but if changed remains in effect as long as the rig is turned on.

You will also be able to use the tuning knob to change the code speed instead of just the paddle.

I think I'm about done with this...

12123. Replacement volume knob for ATS-4

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-22 03:09:22 UTC
From: <owen@...>
Topic: 12123 Message: 12123

I accidentally melted part of my volume knob with my soldering iron. I hate when that happens! The knob is functional but now ugly. Is there a part number I can use to order a replacement?

Also, after putting everything back in the case, I turned up the heat on my iron to solder the (after-market) BNC jack. Then I forgot to turn it back down when I soldered the DC jack. It worked fine for days before this, but now I can only get power to stay on if I press the jack into the socket "just so." I imagine the socket has lost some shape due to overheating, so I'll order another.

12124. RE: ATS-4a - sometimes won't boot, sometimes won't turn off

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-22 03:11:17 UTC
From: <owen@...>
Topic: 11884 Message: 12124

In the end, it appears that this was all down to flux on the board. I cleaned up flux around Q3 and other related components, and now the board consistently turns on and shuts off as expected. I'm surprised that's all it was, but since doing this I have not been able to reproduce my problems despite many attempts. The rig is working well now, I just need to adjust the filters, etc.

---In at_sprint@yahoogroups.com, <steve.kd1jv@...> wrote:

The crystal shouldn't matter, thier all about the same execpt maybe for size. You'd best take a real close look at the solder connections to the pins the crystal connects to at the processor.

As for it not turning off, that is a real simple circuit. Something is keeping the pass fet turned on and there are only a couple of things which can do that. A short across the On switch (the cap or mosfet) or a short at the processor keeping the pin which goes to the gate of Q3 high.

Steve

---In at_sprint@yahoogroups.com, <owen@...> wrote:

So, as I mentioned yesterday, after replacing the dead 32 khz crystal that came with my ATS-4a kit with one from a junk box, I got it to boot up. Since then, though, I'm seeing that it doesn't boot up reliably. One minute it does, the next minute it doesn't. The solder joints are fine, so I'm guessing part of the problem is that I should use a crystal that's identical in spec (not just frequency) to the original one.

Another thing I'm noticing is that when the rig DOES boot, I can't turn it off completely. If I hold down FN, I see "OFF" on the display after a few seconds, but releasing the button does nothing further. The rig seems to be in a locked state and I have to pull the battery to shut it off. What would cause that?

You can't buy just the knob, it comes with the control. Although I did find this knob which might work, but you'll likely have to make the cut out in the case larger as the knob has a skirt on it with 0 to 9 printed on it

Mouser 450-0010, Other wise you'll have to order the control Mouser 311-1202F-50K

The power jack is Mouser 163-4018-EX

Howdy Gang:

I find I am using my KX3 more and more for portable use so am offering for sale my little used MTR transceiver and Palm Paddle.

The MTR is in like-new condition.....and is the most recent version that Steve, KD1JV offered as a kit including the sharp new blue case.

I attached a strip of 3M Dual Lock to the right side of the MTR and another strip to the side of my Palm Paddle and they mate up very well.

As the commercial goes "3M Dual Lock is not your Father's velcro"....GRIN.

This makes a really nice portable package with the Palm Paddle on the right side of the MTR....it is easy to reverse this for the southpaws out there.

The 3M Dual Lock leaves absolutely no residue...I use it on lots of stuff here in the shack.

I will ship the MTR and Palm Paddle for $280....CONUS only please.

U.S. Postal Money order or PayPal (add 3.5% fee) are the methods of payment.

10M has been jumping all day with DX in the CQ WW contest...gonna go back there now.....cu on the air.

From: Kevin Kleinfelter
Topic: 12134 Message: 12134

What's the maximum safe SWR when using the MTR with a 12-volt supply? With a 9-volt supply?

I've recently become an MTR owner. My prior rig had the smarts to protect itself when I ineptly fed it into a high SWR antenna. Since the MTR expects *me* to supply the smarts, it is time for me to become more ept.

I fully understand that a good match will transfer optimum power to the antenna system, and that's a good goal. I'm asking about max safe SWR because I'd hate to 'let the smoke out' as I give up the 'training wheels' of my smart rig.

12136. MTR and solder paste

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-26 18:16:41 UTC
From: <jackier1061@...>
Topic: 12136 Message: 12136

I am beginning to think about starating on my MTR. I have the solder paste and heating element and embossing gun. My question is after I have done the first side (the back side) how do I reheat the front side with the back side already populated with chips?

Won't the heat hurt the ICs and other components?

Thanks for any guidance.

From: Dale Putnam
Topic: 12136 Message: 12138

Nope, won't hurt anything, just make real sure not to bump or jostle the board, while the paste is liquid, or the solder is flowing.Take the heat off.. let it sit, and cool, ... then move the board. Of coarse you aren't going to continue to apply additional heat for an extended period of time, after the paste flows... only long enough to align the components, if that is even needed.
Good Luck, it is a fun build,

Have a great day,

12141. FS: ATS-3B - Built

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-27 15:37:22 UTC
From: Jeff Imel
Topic: 12141 Message: 12141

For Sale: ATS-3B mounted in Altoids tin with custom label identifying the buttons and jacks. It comes with all band models built and stored in their own Altoids tin with foam separators. Includes power cord and an adapter that allows you to use LiPos with Deans connectors and a nice case to store the transceiver, band module tin, plus room for your batteries, ear buds, and etc. There is room enough for a small tuner and wire for your antenna. This is a very nice set-up that is easy to transport in the car or in your backpack.
I had this rig on the air this weekend and it works great. I am selling it to finance another purchase.
$175 and that includes free Insured Priority Mail shipping to your CONUS QTH. I accept PayPal. If you are not happy I am thrilled to refund your money with the return of the radio.
Please contact me off list at jeffimel@...

If you using the internal keyer and a speaker instead of headphones, you can probably live with it. If you use a Straight key and/or headphones, definately worth it as it completely eliminates the thump.

12145. SOTABEAM stuff I just received

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-27 21:36:11 UTC
From: Joe W2KJ
Topic: 12145 Message: 12145

Howdy Gang:

Just got some neat stuff from SOTABEAM in England.

Pretty fast shipping from over the pond too!!

I got a two piece stand for my KX3 that can be used in the shack or in the field...it puts the KX3 at a nice angle for viewing.....the two pieces can lay flat for inclusion into your portable kit.

Also got 4 wire winders that are used to wrap wire or support rope in a figure eight pattern on the forms....the wire simply unfolds off of the holder when ready to deploy.

I always get my support ropes in a tangle...I was in the Army and not the Navy unfortunately....grin.....and these small forms are just the thing for portable wire antennas.

I'm gonna layout my PAR 40/20/10M EFHW and wrap it on one of the forms and see how it fits.....too cold and rainy today so will put it off until tomorrow afternoon.

These little winders will find many uses for field use I am sure.

New toys are always fun!!!

Joe, those winders are pretty cool. SOTABEAMS has a lot of neat and practical items for sale.

I was not in the Navy but I have been using the figure 8 technique since my early days in the Air Force in order to allow 5 level paper tape to feed through the teletype (model 28) without getting tangled. A friend did a short video of me winding an antenna this way. https://www.youtube.com/watch?v=PFUEvrwkHZg https://www.youtube.com/watch?v=PFUEvrwkHZg

My method takes practice, the winders do not have a learning curve so they are a pretty good deal.

I use a bug, sideswiper, straight key, or external keyer about 90% of the time in my normal routine. Without doing this modification, it isn't practical to use any means of external keying. At least half of the fun of using cw is being able to send, using my "CW" voice, developed in its best form while using external keying. Of course, the bug is out when it comes to hiking the trails.

I haven't done the mod yet because I'll need to tear it down when the new chip and manual become available. Bottom line is, yes this mod is worth doing and shouldn't take more than ten-minutes, once you have the board in hand.

Hey, folks:

I'm also a Mac user, and have a simple method to keep the list readable: don't visit the Yahoo web site. Interact with the list strictly by email. Mail.app - or any other modern email client - will let you sort list emails into their own folder and view messages by thread.

If people really want a different platform - and Steve is willing to do it - QSL.net offers free email list hosting for ham groups. However, that system uses GNU Mailman. As an administrator of several Mailman lists, I can attest that it's typical GNU-ware: immensely powerful and totally free, but equipped with an utterly obtuse interface. We'd most likely be trading one set of problems for another.

Took a week for the digest to start arriving via email after turning it on, I have no idea why.
In the meantime I mostly made my peace with the botched Yahoo web interface.

I doubt using a web browser into Yahoo is much different on a Mac than on any other OS.

Hi - I lost a large portion of my computer system, and along with it all my passwords, etc. I have tried to log on to Yahoo Groups with my ID, but when I try to change my password, I am told that it is weak, and not acceptable, so I can't continue. I have tried entering random groups of letters and numbers (8 to 32 characters), but no matter what I try, I cannot generate a password that is suitable for Yahoo. I would like to contact the moderator, but I do not know how. Any suggestions? Thanks, John, W7COI

John:

Sounds like you have a malicious "Redirect Virus" which is causing your problem with Yahoo.

If the virus hasn't screwed with restore points, use windows restore, choose a restore point as far back as is listed on your computer, This might be all you need. Windows Restore has saved me several times from such mischief.

Check your computer for a virus, using something like Hitman Pro. Best to download Hitman Pro on a "known clean" computer which is different from the computer which is giving you problems. Hitman Pro has a trial version which is usable for 30 days without payment. If you like it as I do, you might even buy it.

There's another totally free malware/virus programme called Malware Bytes, but Hitman Pro seems to do much better.

Could well be malware. Nasty.

Perhaps verify by trying to reset the password on some other hopefully clean computer.
If they somehow now have access to your yahoo account, they might have access to things
like your amazon account, or whoever you communicate with through your yahoo account.

The nice thing about yahoo groups is that they let us share files and pictures. An email based mailing list like qrp-l isn't going to cut it. Other social media like Facebook or Google+ might come close, but they don't offer the file sharing. I guess Google has a file sharing feature which might be usable, but it would be seperate from the group, making things a bit complicated and confusing.

Steve KD1JV

If people really want a different platform - and Steve is willing to do it - QSL.net offers free email list hosting for ham groups.

12165. New MBDC firmware - started to ship

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-11-29 22:20:07 UTC
From: Steven Weber
Topic: 12165 Message: 12165

I finally started to send out the new MBDC rigs firmware chips. I got just over 50 into the mail this afternoon, the balance will go out Monday, most of those to DX stations. I hope everyone who has already built the rig will get the new chip in time for the ARRL 160 M contest on Dec 5th. I'll have to remember to get on the air myself that that and see what happens :)

Also included are the resistor and diode needed for the thump mod. Be sure to look for them, as they are taped to the side of the insert I added to keep the chip carrier from punching through the envelope. That keeps them from rattling around.

As for the original processor chip, you can send it back to me if you like and I can recycle it. But if you bought a spare display and DDS module, you could keep it and use it for a signal generator or something.

Steve KD1JV

And if anyone finds a new bug in this firmware, I'll just go out back and shoot myself in the other foot....

Topic: 12134 Message: 12168

I don't have an MTR rig, but I think the standard for the Weber ATS rigs has been that 9 VDC is safe, and its also a good idea to use an SWR indication system having an inherent internal load in line.. such as the Doug Hendricks kit LED based SWR indicator (Dan Tayloe circuit, same thing is in the ZM-2 tuner).

In the case of my ATS-4, I did a simple inline regulator circuit on a vectorboard with a regulator and capacitors and put it in-line of my bench 12/13.8 VDC supply or my external 12 VDC lead-acid battery (for patio/deck open-air radio).
With that 9 VDC from the regulator, I should be good.

Brien
VE3VAW
Toronto ON

---In AT_Sprint@yahoogroups.com, <kleinfelter.groups@...> wrote:

What's the maximum safe SWR when using the MTR with a 12-volt supply? With a 9-volt supply?

I've recently become an MTR owner. My prior rig had the smarts to protect itself when I ineptly fed it into a high SWR antenna. Since the MTR expects *me* to supply the smarts, it is time for me to become more ept.

I fully understand that a good match will transfer optimum power to the antenna system, and that's a good goal. I'm asking about max safe SWR because I'd hate to 'let the smoke out' as I give up the 'training wheels' of my smart rig.

12169. ARRL 160 Contest Next Weekend

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-12-02 00:10:12 UTC
From: Hank Greeb
Topic: 12169 Message: 12169

Yup, it's that time of the year, again. The ARRL 160 meter contest starts 2200 UTC Friday, ends 1600 UTC Sunday (December 6-8, 2013). This is a forty-two hour period with no time limitation. (n8xx note - IF you can make many contacts while the sun is shining in your area, well, then, you are in an area where the number of 160 meter ops are very densely situated.)

Rules for this event are at http://www.arrl.org/160-meter

Note that there IS a QRP category, and there are quite a few entries in the QRP category (81 from US/Canada out of 1047 entries from the same area.

AND for those in the group which have a working Muti Band Direct Conversion rig working on 160, this would be a GRRRRRR8 opportuinity to put it through its paces.

My MDBC is still in the box. I guess my pending membership in the procrastinators of America is one reason, but then I've heard there's a new firmware for the software, so maybe this will be better for me. :) But, you may wish to crank up that MBDC make sure your antenna is usable on 160, & give it a whirl!

12170. New MBDC firmware chip

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-12-02 00:59:05 UTC
From: Steven Weber
Topic: 12170 Message: 12170

Well, it seems I need to go out back and shoot myself in the other foot. Just found a minor problem with the new firmware I sent out while double checking the instructions for the manual revisions for this firmware.

Seems I got the band selection reversed. It comes up as 80M in the 160M filter switch position.

There are three ways to fix this:
1) Swap around the fitler parts (not too practical an idea if you've already installed the parts)
2) Do a "cut and jump" to reverse the connetion on S3 going to R30. (good thing I made ground the common pin on the switch!)
3) Reprogram the band selections using CAL mode so Band A is 80M and Band B is 160 M. This is the easiest option.

I'll fix this with the chips I haven't sent out yet, which are primarly to DX stations.

Sorry about this.

Steve KD1JV

Steve,

I'm so immersed in "renovating" my workshop that I haven't had time to get involved in anything smaller than wristwatch tool kits, and I need to send some work off to Dale, almost glad I have too long a work list!

Don't feel bad about feeling the need to shoot oneself in the other left foot, I've found an "expensive" wood handled titanium hammer that I thought some "wetback laborer" had put in his toolbox, then located a brake fluid bleeding and replacement tool for my sister's huge Dodge Charger, so I'm now wondering if I can put the watchmaking tools on a bench to await time for the "discovery" of a box of parts that were for a computer upgrade.
Meantime, I'm taking pain pills for the back pains, will use them up as I get the big machines and tools set up for ease of access, and keeping my eyes off the .22 gauge loads that fit my one rifle, it's too tempting to see if I can ventilate my boots, they cost too much!

Thanks for the hints, I'm almost at the time frame when I need a hint of a direction to a place where someone smarter than I am makes and sells 160 meter antennas!

My sutures come out Tuesday morning, and I hope I get a petty little "knit and cut" nurse, instead of that surgeon, he nearly choked when he had to suppress a guffaw, had asked me "Any questions about this procedure?", so I stated, calmly, "Will I be able to do the 100 yard dash after this is done?". Two nurses across the hall heard me, they looked at me as though my head had Swiss cheese running out of my ears. I tell many friends that I thought my head had silly putty in it, until I looked at the young, drunk woman driver of the SUV that tore off the porch of the office across the street, then mowed down my fence, put holes in the side of the workshop!
Guess who has to pay for the rebuild, since she has NO insurance, and I hope she lost her driver's license!

73's, I enjoy your finding your own bloopers, makes me recall the T-282 transmitter, Korean War vintage, that I ended up memorizing over my three years in Oregon, hated that UHF monster! (No one let me know when the Air Force removed that building, I'd have volunteered to destroy part of it with a sledge hammer!)

I just up loaded the new manual to the MBDC folder for the chip many of you just received. The original manual has been renamed mbdc_old.

The new manual explains how to reprogram the band selection, which can be used to fix the inverted default band switch selection. This only takes a minute to do. While you can send the chip back to me to reprogram (you might want to send the original chip), it will be quicker and easier just to reprogram the band selection yourself.

If you do send the chip back, you'll want to package it a little better then the way I did, had at least one tare through the envelope and get lost. Should have taped around the inert I made so it couldn't slip out.

Steve;

Got a bit of a surprise in the letter section of the Post Office today, "a chip, a diode, and a resistor" are in the envelope, so that item came through FB. Now, to download the manual, start looking for all the kits. Somehow, between now and late springtime, I have to do the renovation of my workshop, my "hobby cabin", and get all the rigs going. With luck, I can get antennas set up,but someone needs to take pity on an old ham op, point me at the place where I can get directions on a 160 meter antenna!

Most any length of wire, preferably 100 feet or longer, and as high as you can get it, can be matched with a transmatch to 50 ohms. The higher the better, and the best counterpoise/ground plane you can muster, will make it more efficient. But, my pappy used a 100 foot or so piece of wire, with just a simple ground steak, loaded it with a pi-network tuner, and talked all over southeast New Brass Key when I was a kid. Personally, I use an 80 meter doublet, configured as an inverted V, to which I add about 60' of wire on each end at about 10' off the ground. I feed it with 400 ohm (nominal) window line, and use a LDG 4/1 balun and a LDG Z-100 tuner to convert the impedance to 50 ohms. I sometimes have to adjust the length of the extension wires if I want to deviate too far from 1800-1850 KHz, but that's a matter of trial and error.

There's discription of couple vertical antennas in recent QST magazines, if you don't have access to QST I can look them up and send you copies.

Unh, yeah, I was warned about that, and my sister is "retired and tired of long pieces of wore", my best guess is to put them up on the quarter-of-a-block size lot, then stick a lot of stiff wire in the ground for a counterpoise, "tune for minimum smoke".

I think I can fudge in "connecting pieces of wire" on my acre-sized lot in Yorktown, got a new wire loom fence going in soon. Maybe the collection of color TV tube "loops to make the color guns go where they need to go" on the ancient old sets would come in handy.

Hi Gil

Simplest way to get going is to put up a low dipole – even if you just get at least the middle half up in the air 20 to 30’ above ground you’ll make some contacts. Inverted-Ls and counterpoises take a bit more work.

Subject: Re: [AT_Sprint] 160 metet antenna

Unh, yeah, I was warned about that, and my sister is "retired and tired of long pieces of wore", my best guess is to put them up on the quarter-of-a-block size lot, then stick a lot of stiff wire in the ground for a counterpoise, "tune for minimum smoke".

I think I can fudge in "connecting pieces of wire" on my acre-sized lot in Yorktown, got a new wire loom fence going in soon. Maybe the collection of color TV tube "loops to make the color guns go where they need to go" on the ancient old sets would come in handy.

Steve;

There are a few others who have advised something of the same idea, so I have a bizarre idea to fake out someday, when the cold fronts have finished blasting through. I have to be careful on this island city lot, there are many rental cabins that my Dad built, starting in 1937, they all are "set back from the fence" about ten feet or so, I got an idea to attach the tallest pole of fiberglass I can find to the corners of each one, they are in a "C" formation with the entrance through the fence being the opening of the "C", my ham radio cabin is one end of the "C", another cabin is at the other end. My main worry is about the ratty city kids who move here with their parents, the types who have "0" on their foreheads, enjoy destroying the picket fence that my sister had installed longish ago, thus I'm considering an intrusion alarm of some type, to alert me to "ratty kid jumping the fence to get to anything in the yard".
By setting up the tallest flex pole possible, I can jury-rig a LONG piece of wire, or perhaps a lot of TV lead in, from one cabin at the entrance to my cabin, run a counterpoise off one side, place a LONG length of ground - resistant wire at the bottom of the fence itself, then attach a hefty tuner to all the wire. Might even work, the only real problem is in guying the poles, need to keep them as small and not-easy-to-see as possible, yet high enough to do the trick. If the local high school wasn't just two blocks away, I wouldn't have any problems with "teen gangs of no brains, pulling stunts of destruction", seems to be a common theme with city kids who move here with their parents, they tend to be beer drinkers or worse, give their kids money to "go get a burger and sneak in a beer", think up the most destructive activity possible.
Strangely, I carefully built two 80 meter and 40 meter "coax dipoles", have yet to try setting them up due to work interfering with hobby items, then my dizzy sister thinks it's cool to run over anything left on the ground with the riding lawn mower! I have no idea why she hates ham radio and antennas so much, but I have to replace a coax dipole a little too often. If she doesn't do the damage, she hires some "zero brain" to weed-eat the fenceline, also around the cabins, and that plastic line can do some damage to wire antennas, even hot and cold water PVC valves, set up for ease of turning off each cabin as is needed for maintenance. You can't believe how much work it is to shut off the main water supply line, dig down around the fractured pipe, replace the valve with a new one, note the damage to the building, even.

The latest "stopping point" happened when a drunk woman did 85 mph down the main city street, her SUV jumped the curb, hit and knocked down the ad sign poles, incredibly huge "power pole" type, slid up the fallen

poles, flipped over, landed on its driver side, skidded sideways across the street, rammed and flattened my very heavy fence, ended up ramming and breaking half the wall of my one cabin! I now wait for cold weather to blast past, get wood and "interior tool items" out of the workshop, let the contractor replace everything. Drunk drivers usually kill themselves, but she was "lucky", got out of the wreck with a broken left arm and leg. Of course, NO insurance, she is one of the types who buys a buggy, makes one payment, cancels it after getting the license tag, and drives like a suicide type!
I noted that my ground radial for another antenna idea did survive, it was lightly buried to keep the "weed trimmer" idiot from damaging it.

Thanks for the ideas, 73's

12188. MBDC Problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-12-04 18:45:10 UTC
From: k1thp
Topic: 12188 Message: 12188

I received the new chip and attempted to set up the switch positions according to the new builders manual. The new positions do not appear to be saved. When I place the slide switches toward the rear the display shows 1.860 and when I move them towards the front I get 3.560.
I also no longer have output on either band. When listening on my K3 I cannot hear a signal. As I adjust the trimmer on the Oscillator board CCW I reach a point where the displays shifts contrast and I can start to hear the signal on the K3 and it is weak. Are the BS170's fried? They don't measure a short but show a high resistance source to drain. This rig probably won't make it to the contest this weekend!

HELP!

Dave K1THP

When you restart the band setting routine, it starts from scratch, so it doesn't show what it was set to before.

Once again, the proper setting is 160 is with S3 (and S4) towards the rear of the board and 80 towards the front.

As for no power out, that is harder to explain. Try the original chip again as see if it works with that one. If the display shifts contrast, then your supply voltage has to be dropping a lot to loose regulation on the 5V line. That could be your turning the '170's on so much they are drawing excessive current or your using a dead battery or a supply which can not supply sufficent current.

From: k1thp
Topic: 12188 Message: 12190

Steve, What you said in the E-mail is opposite of what is in the revised manual. In the manual it says to set up A for 80 with the switch to the rear and 160 for B with the switch facing the front. That is opposite from the way the filter toroids are installed on the board. I will give it another try after supper. Also my power supply is a CUP36-12-1 B2 rated at 13.6 Volts at 2.4 amps. I use it to run my KD1JV Tribander and my KX-1 with no problems.
73,

Dave

Your not reading it quite right. The new processor has the switch sense backwards, so it thinks band A is towards the front and B is to the rear. So to fix this you must redefine the band selection so that band A is 80, (switch now towards the front) and band B is 160 (switch now towards the rear) as specified here:
NOTE: If you have one of the new firmware chips with the band selection reversed, Program Band A to 80 meters and Band B to 160 meters.

Is it really that confusing? I suppose it must be.

Well that is what I ended up with and the Rx works fine except for some BC blowby. I have heard quite a bit of Eu dx on 80 this evening. Its the TX that is making me nuts. I get 1V p-p across 50 Ohms on 160 and 1.25V p-p across 50 Ohms on 80M. I am measuring with a Tek 2445 scope. I double checked the capacitor values and the turns on the filters and they all are according to the manual The supply is stable at around 13.5 volts. An interesting side note is that as you turn the blue trim pot ccw the output goes from zero then peaks and falls back to zero. If you continue after that the display starts to change contrast but it is after the peak. I was watching it on the Elecraft P3 panadapter. The output is very clean! If I keep the key down, the BS170 fets warm up but not enough to burn my finger. All three are about the same heat (subjective). Where do I go from here?

12195. ATT: Steve Weber MBDC problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-12-05 05:00:54 UTC
From: <wlinn.linn@...>
Topic: 12195 Message: 12195

Not a new topic but Yahoo's "Reply" function wouldn't work with my Linux OS..

I think I understand your instructions in the latest manual for those of us who got the chip with the band identification sense reversed. However, when I go into the routine you describe, I get no indication of "Band A" or "Band B" and when I get to the band selection and scroll through the bands the selection does not "roll over from 10 back to 160, instead it just stops there. (Which indicates that something is amiss.)

WA7ZYQ, a friend who lives here in town also bought a kit which he has not built and he should have his new chip by now. Since he isn't building the kit right away, I will see if he will loan me his chip and see if it acts differently.

Again, I get no indication of Band A or Band B to assign the band changes to. Makes me wonder if others are experiencing this? Or, perhaps I'm missing something even though your instructions seem clear enough?

Bill - W7WEL

Well, since these modules draw 125 ma all by themselfs, thier not real suitable for battery operated rigs. That's what it takes to power four MTR rigs! Plus I hate doing SSB rigs - people have a real hard time getting them to work so I have to do even more hand holding then usual. But you never know. Maybe I should see about converting the Survivor to SMT and 9834 VFO. And figure out how to get full power out over the full band...

72, Steve KD1JV

Weird.

I've ordered similar in the past and recall being spoiled for choices.

Try going to http://www.digikey.com/product-search/en/connectors-interconnects
select "Barrel - Power Connectors", then filter for "jack" and "0.7mm..."
Do not filter for "surface mount" or it will not return any results.

I get a couple dozen results, all of them right angle surface mount.
I suspect you want something like this one:
www.digikey.com/product-detail/en/PJ-032H-SMT-TR/CP-032HPJCT-ND/1530990

Get out your calipers and compare the old one with the dimensions in the data sheets.

The one used on the ATS3A has the switch inside, but that third contact is not actually used.

Lettuce C. We could outsource all construction, testing, etc., to China or Bangladesh, along with use of counterfeit DDS boreds and off spec components. With these short cuts we might have a 5 watt multi-banned rig for <$20 like the 2 meter and 440 Mhz knock offs from there?

Maybe go back to the basics, a tough little monobander. Cheap enough so
you could take two or three if you needed more bands for the outing.
Wait, maybe that has already been done.

Make sure your getting the supply voltage to the BS170. Could be as simple as a bad connection to the drain choke. Or maybe the voltage keying fet isn't working, but that is much less likely.

Since you have a scope - follow the signal. You should see about 25-30 volt pulses on the drains of the BS170's and at the input to the filter. If you get that there, see where in the filter it goes away.

Again, I get no indication of Band A or Band B to assign the band changes to. Makes me wonder if others are experiencing this? Or, perhaps I'm missing something even though your instructions seem clear enough?

I think your trying to use the wrong function. BAND as selected by the menu switch during normal operation simply loads that frequency, it does not change the band assigment of the band select switch or change the band limits for transmitting. To redifine the bands selected by the switch, you have to get into the calibration mode.

Enter the calibration mode by turning the rig on with the MENU switch closed.

The display will read

125,000,000
CAL

Push the MENU switch again to "click" past this (or calibrate the DDS frequency first)

Now the display will read:

160 SET A?

That is asking if you want to set band A to be 160 meters. No, you want it to be 80, so push the MENU switch again to make the display show 80 SET A? and push the encoder switch.

Now the display will advance to read 40 SET B? No, you want it to be 160, so push the MENU switch 6 times to get back to 160.

You will see:

30 SET B? (push switch) 20 SET B? (push switch) 17 SET B? (push switch) 15 SET B? (push switch) 10 SET B? (push switch) and then finally 160 SET B?

I would have made the display message a little more explicit, but I ran out of memory. I had 4096 bytes to use, I used 4096 bytes!

Hi Steve, I tried the Mouser on line catalog, but couldn't find the right pot. Maybe I'm just too dumb!! I changed a couple of component values on the SMK-2 and decided to do the resoldering in the toaster oven. However, I forgot about the plastic shafts on the pots!! I want to get this thing off the bench so I can take my MTR kit out of the box and get it on the air!! Thanks for taking time to answer. 72 de Jack

At key down the drain voltage is 13.3Vdc. The input to the filter (output of C41) is a distorted (square wave with spikes) 1.5V p-p. The output of the filter is a clean 1.4V p-p sine wave. Also, the gate drive is a dirty square wave at 1.3 volts peak above ground. Looks like the gates are loading the 74AC00 chip output. The other night this whole board was putting out about 5W on 80M and 3.5W on 160M so I have some confidence in the build. I might be able to get BS170's locally but at inflated prices or will buy (or barter) from you if possible.
What now?

Second try in responce to this info.. Finally understand..followed your instructions and it was a snap!

I had a very enjoyable evening working stations around the northwest.

Thanks for your patience and another FB little rig, they just continue to get better and better. Not any qrp rigs will compete with the standards you have set. Who can complain about a rock solid vfo, digital readout to a hertz, and a built in keyer with lots of memory and Beacon mode too! You get two bands for transceive operation and, if you are so minded, you can modify the little guy to function on most hf bands, just pick the two you want. Steve has also made provisions for out of band swl'ing. I'm sure there are other features I've missed.

Steve, if you have a spare kit stuck back somewhere that you would turn loose of, I'd like to build one for 40 and 20..

Something was once said about the possibility of SDR capabilities. This could be fun too.

I've already made firmware with X4 output on receive to use with a R2 board for someone. Of course, this limits the tuning range to the top of the 30 meter band. Otherwise, one could build an daughter board with a second HC4053 mixer and the flip-flop to tack in over the existing board. I'm thinking a second itteration of this project might include the second mixer and divider for generating the 90 degree LO. Maybe leave the complete audio chain on one channel to use as a monitor or stand alone use if desired.

Some other ideas I've had for this rig is make a low power AM transmitter using the voltage keying mosfet to modulate the output. Or you could scale back the output and drive a diode mixer to make DSB. Although doing this you'd really want to also add a linear amp to get some reasonable output.

Although I didn't make it real easy to add stuff to the board, I was hoping some of you would use it as a platform to expand upon and experiment with. That's one reason I allowed the receiver tuning range to take full avantage of the span the DDS is capable of.

Steve,
I suspect it may be related to the Band A/Band B thing but I just discovered that when you go to store the STR frequency say for 80 meters at 3551 and restart the rig, 3560 still comes up. If you switch S3/S4 to the back for 160 3551 comes up. The work around is just to store the desired starting frequency for 80 in the 160 S3/S4 position and vice-a-verse for 80. But for those of us who return our chips, it seems it would be nice to fix if possible, Also a minor thing is that if you select 17 m Band it wakes up at 18.680 which is outside the band, I suspect is was intended to be 18.068.
Please count me in if you ever need any beta-testers. I obviously don't have much to do.
Cheers, /John

> Thank Steve, but I got some locally. There is a store in Newington, CT called Cables and Connectors and they had some on othe rack. Turned out to be pretty cheap, 3 for $1.89. So if you have not mailed them, don't worry. My final check was to punn the 74C00 and measure from pin6 (the Gate string) to source and drain. I measured 300 Ohms gate to drain! So I went to Cables and connectors picked up the transistors as well as some parts for other repairs and projects. the only downer was the 15 mile trip to a road that is populated with shopping centers.

I also installed the key pop mod and find that it now really pops. Testing on a dummy load with a straight key. After I finish setting the power I may work some contest Pops or no Pops. Since I usually use a paddle it may not be a problem. Heck I've been shooting .45 Ball ammo for years and I still can hear.
73 and thanks for a fun project.

Here's an interesting alternative to AM or DSB phone: http://codec2.org/
Especially interesting in that it can go through a non linear amp, being a single tone at any one instant.. So could transmit by manipulating the DDS and the keying FET, (Also true of PSK31.) I'd expect decode to be possible on a Tiva uC with just a few ma, perhaps even a high end MSP430 (or Steve's new DSP chip?). PSK31 decode is possible on a low end MSP430 as shown in the files section under KE7ER/pskuc.

I think a neat approach for a new project would be an MTR size and power budget single band base board with hooks for a second board to optionally support displays, multiple bands (using latching relays hand added to the base board?), antenna tuner, SDR or whatever. Autostuff one side of the base board with 0402's and fine pitch parts, enough parts to allow a quick go-nogo test before shipping. The buyer mostly winds coils, stuffs filters for a particular band, mounts connectors to the board (feedthroughs an connector pads to avoid pads ripping up). Autostuffing costs a few bucks but there's no need for Steve to cut and label so many dinky parts, which might go some end toward paying for the autstuff. More hams would be able to get something working. Those who really wish to get their hands dirty building could collaborate on creating daughterboards. Here's one potential board fab house: http://oshpark.com/

Jerry Gaffke, KE7ER, Flora OR -- cold here today!

Humm, I forgot that function would also be affected. Or I did and thought reassigning the band switch would take care of it. Minor detail :)

But anyway, if you do return a chip for reprogramming, that gets fixed when the switch selects the bands in the proper positions.

17M coming up wrong is a typo. Actually, the number is stored as binary and converted to BCD for display, as it is easier to work with binary numbers. It takes four bytes to store a frequency so I probably revesed the nibble in one of the words while typing it in. Another minor detail, but thanks for letting me know.

Steve

Steve,

I suspect it may be related to the Band A/Band B thing but I just discovered that when you go to store the STR frequency say for 80 meters at 3551 and restart the rig, 3560 still comes up. If you switch S3/S4 to the back for 160 3551 comes up. The work around is just to store the desired starting frequency for 80 in the 160 S3/S4 position and vice-a-verse for 80. But for those of us who return our chips, it seems it would be nice to fix if possible, Also a minor thing is that if you select 17 m Band it wakes up at 18.680 which is outside the band, I suspect is was intended to be 18.068.

Please count me in if you ever need any beta-testers. I obviously don't have much to do.

Cheers, /John

On Wed, Dec 4, 2013 at 11:32 AM, Steven Weber <steve.kd1jv@...> wrote:

When you restart the band setting routine, it starts from scratch, so it
doesn't show what it was set to before.

Once again, the proper setting is 160 is with S3 (and S4) towards the rear
of the board and 80 towards the front.

As for no power out, that is harder to explain. Try the original chip again
as see if it works with that one. If the display shifts contrast, then your
supply voltage has to be dropping a lot to loose regulation on the 5V line.
That could be your turning the '170's on so much they are drawing excessive
current or your using a dead battery or a supply which can not supply
sufficent current.

You can if you like as I can recyle the original chip, but you don't have to. But in your case Gil, you might want to send both back so I can fix the band switch assignment problem so that you don't have to remember to fix that on your own.

Steve

In my foggy, rather too long of items list, did I miss the idea of sending the original chips back to Steve? I have to find that package, first, on a "wish it wasn't freezing outside" floor.

Ol' Steve-o must have quite a 'kitting' system. I just finished inventorying the parts in my kit and, of hundreds of components, there was not one missing or of the wrong description or value. Quite impressive. There were 2 parts in the inventory not on the list, the 470pF disks (C12 & 13 in the audio filter) but they're on the schematic so no worries. Almost time to snort some rosin fumes.

Way to go, Steve!

Got the MBDC working last night. Have 5 watts on 80 and 2 Watts on 160. Set up 80 first then switched to 160 and found low power. Remover 4 turns from L2 the output toroid and 1 turn from the input toroid. Power went from 1/2 watt to two watts. Probably could have tweaked the vfo output pot but don't want to change the fets again. Worked several stations on 160. Not a contest grade radio but will provide lots of fun this winter on rag chews and some 80 meter qrp nets. BTW I removed C17 and WTIC is at very low level (barely noticible) during daytime and after they change the night pattern the problem is gone. The other local AMers don't make it in after the C17 removal.
Sending you the original chip so it can be recycled.

A few more vague thoughts and then I'll try to quiet down.
I'd like to see another trail radio, small and easy on the batteries. But flexible enough to add standalone digital modes with that daughterboard thing. I think that means a crystal ladder filter and a single channel of audio, just like the MTR. Not two quadrature audio channels and no 4x oscillator. Fine to have an MSP430 on the baseboard, but should be hooks to the daughterboard to allow something like a Tiva to shut down the MSP430 and take full control. And if the daughterboard fails in the field, should be possible to bring it back to basic functionality using only the baseboard without special tools.

Rewound inductors and replaced caps as per Steve's chart. Getting close to 5 watts output. NOTE- If you do this conversion, remove C50, it is 1500 pf and 1/2 of the 3000 pf used in the 160 meter filter. Steve's values are spot on. First station worked was in New York, also qrp. This little rig is amazing! Bill - W7WEL

Available source code for digital modes is generally aimed at an x86 desktop/laptop. Porting to a trail friendly uC and creating a decent user interface will take months or years. Might not be a task Steve wants to take on. I'd be happy with an MTR that's easily expanded in new directions.
Anybody out there have the time and inclination to try decoding a favorite digital mode from receiver audio using something like the $12.99 Tiva Launchpad + DOGM display?

How would you go about plugging a rigblaster into a smartphone? How many hours till recharging when actively processing digital radio? I can imagine an entire Tiva based solution with display fitting into an altoids tin. With a nice quiet switcher, power requirements could be under that of the MTR. Granted, hooking an MTR like radio to an x86 laptop (or palmtop) is easier and more flexible, but perhaps best suited for car camping. The 64 pin LQFP TIva is a half inch across, includes a couple ADC's, hardware support for 32 bit floating point, would probably draw 1ma or so at 3.3v when performing the duties currently taken on by the MSP430. About $5 through digikey.

Even better would be to do most of this on Steve's little DSP chip, if possible. But existing programs would port much more easily to the Tiva.

For a smartphone?
Is that' with an acoustic connection, from the radio's speaker into the phone's mic, for receive only, no control at all back into the radio? Though just monitoring like that could prove useful. I assume full functionality with software available to us using anything like a Rigblaster would take a bunch of cables, and a computer with a soundcard and an x86 processor. Perhaps something similar could be done over bluetooth with your phone, but that would take some work to get going, maybe more work than getting the Tiva to do it all. One other issue: Many have reported their MTR is unusable when in the vicinity of a cell phone.

JT9 is 9-FSK, so 9 possible frequencies sent one at a time, should work fine through something like the MTR transmitter by manipulating the DDS. http://ac4m.us/jt9.html
Unfortunately, codec2 on HF typically uses the FDMDV modem on HF, which is a total of 15 different carriers sent simultaneously: http://n1su.com/fdmdv/FDMDV_Spec_v1_3a.pdf

The MTR and all ATS rigs starting with the ATS-3B already does PSK, FSK and serveral other digital modes, even CW. The catch is you need to run Pocketdigi to interface to the rig.

The reason Pocketdigi is needed is because Vojtech, OK1IAK devised a unique audio modem to talk to the ATS rig via the paddle jack and take control of the DDS and T/R functions.

However, if JT9 requires 9 simultaneous frequencies, that can only be done with a SSB transmitter and a sound card.

I'd prefer something standalone and extremely low power, using a display and processor embedded in the rig. Not using a handheld PC. JT9 is 9 tone MFSK, one frequency at a time, so should work fine. Extremely slow, but could be handy as a last resort for getting a brief message through. Digital voice with Codec2 on HF uses the FDMDV modem which has 14 simultaneous QPSK carriers plus one BPSK carrier. So can't transmit it through the DDS, would require something like that SSB transmitter. The modems used with Codec2 at VHF/UHF are one frequency at a time, but consume much more bandwidth than we can use at HF.

At codec2.org, it suggests the single tone modem used on the VHF bands works with 2.5 KHz of spectrum, less than that of an SSB station. And that figure could go down towards 2 KHz as development proceeds.
According to this article from Nov 2013, the ARRL is petitioning that the FCC allow any data transmission of 2.8KHz bandwidth or less on HF. If that goes through, an MTR like radio could send codec2 digital voice.
Note that while current rules restrict the digital symbol rate to 300 baud, they do not restrict how many bits you can stuff into a baud by using multiple carriers. The FDMDV modem is 50 baud with 2*14QPSK+1BPSK=29 bits per baud, for a data rate of 29*50=1450 bits per second. I'd guess the primary reason for the 15 carriers is to get around the current (rather archaic and arbitrary) rules for HF.
I've mentioned codec2 and JT9, which are at the far ends of speed (and link reliability) given current state of the art. There are of course many possibilities in between, such as JT65 and PSK31 Olivia and so on. If the MSP430 were swapped out for a $5 Tiva and the option of a DOGM display were accommodated (plus a DAC if we want voice out), we might be able to support any of those single tone modes with an MTR like radio. And Steve would never again have to count his remaining bytes of flash (until he starts coding in matlab).

Steve,

I looked into doing this several years ago, and IIRC, Pocketdigi only runs on PDAs. With much of the world using tablets and cellphones, this doesn't strike me as a very useful option today. There are only a limited number of hams who will be willing to track down and use a PDA that is unsupported and no longer manufactured.

Yeah, I've not gotten much into C++ myself, what little coding I've done has been confined to C or Python. And I'm certainly no DSP guy, as anybody reading that KE7ER/pskuc.c file could tell.

I'd suggest a path forward something like this:

1)
Move MSP430 assembly for DDS and keyer and such over to C as it should have been 10 years ago, make sure it still works. (That's where I got hung up on pskuc.c, couldn't figure out your assembly well enough to plug into it after several days of staring.) The MSP430 is actually pretty good with C if you use the default 16 bit ints.

2)
Hold the MSP430 on an MTR in reset. Using the $12.99 Tiva Launchpad to drive all those MSP430 IO pins, see if you can get that C code to work properly on the Tiva. Compile using the free (as in beer) GNU tools. Verify that current draw is sufficiently low.

3)
Layout an MTR like board with the $5 Tiva processor. Include a connection for received audio into a Tiva ADC. Send a bunch of Tiva IO pins plus other nodes to connectors for daughterboards so we could add a DOGM display, better ADC, a DAC for phone reception, USB keyboard, perhaps expand on the number of bands supported using latching relays, a switching power supply for 3.3v (hopefully very clean), modulate the final. But should still have a working CW rig if you strip it down to just the baseboard.

4)
Magic happens.
Specifically, somebody steps forward and ports some of those digital modes over to the Tiva. Me, perhaps, if I have time later next year. If it never happens, you've added very little to the cost of the MTR by using the Tiva and now have oodles of flash and RAM to play in.

I certainly wont argue if you decide not to go for it. At least not much. Maybe a 64 pin LQFP is more than you want on the board (though only some of those pins need to be soldered down). Continuing to build small trail radios just as you have been would be more than good enough. But at least consider moving to a more capable uC, with hooks so your creations can be expanded in hardware as well as software.

Here's source for WSJT-X, with modes like JT9 and JT65:
http://physics.princeton.edu/pulsar/K1JT/wsjtx.html

Here's a webpage on Codec2 http://www.rowetel.com/blog/?page_id=452
Looks like he has packaged up his source very nicely for experimenting with.

Seems to me that if single carrier Codec2 on HF becomes possible through an FCC rule change, there would be plenty of folks that would go for it, simply to allow the use of a non-linear amp. And since the VHF modems would be in all those x86 software radio packages

with the proper hooks into Codec2, it would be very easy with for the average ham to talk to us with a standard x86 PC and SSB transceiver.

There may well be reasons other than FCC rules for FDMDV being 15 carriers on HF, I really wouldn't know. Could they have used 65 tones one tone at a time like JT65, sped up to 200 baud? And perhaps the 80 MHz Tiva won't have the horsepower to do an FFT fast enough. But given my experience with pskuc.c, I'm pretty sure we could at least get something going on PSK31

Tiva probably won't run codec2 for voice, though sounds like it's within shouting distance:
http://www.mail-archive.com/freetel-codec2@lists.sourceforge.net/msg01870.html
Most of the other HF digital modes are considerably slower.

I have no idea what modem they were trying to run with, the bandwidth of the incoming audio they were dealing with, or if algorithm performance has improved since then. Also, the discussion was with regard to codec2 in duplex mode, we would be running simplex. The Tiva would not be a bad choice, codec2 is a worst case and not even a choice for us given current regulations. The STM32F4 mentioned in the discussion pointed to is also a possibility, with a $14.90 development kit and $8/part in 100's, same 64 pin LQFP package.

Yes, I'd thought about doing that especially after I also found the alternative assembler code from W1MT which some people think is a better keyer.

> The MSP430 is actually pretty good with C if you use the default 16 bit ints.

Agreed, although the architecture design is a bit dated.

I'd be interested to know why you suggest the Tiva which is an ARM Cortex M4, I've been thinking of doing something similar based on a Cortex M3

JT9 is 9 tone MFSK, one frequency at a time, so should work fine. Extremely slow, but could be handy as a last resort for getting a brief message through. Digital voice with Codec2 on HF uses the FDMDV modem which has 14 simultaneous QPSK carriers plus one BPSK carrier. So can't transmit it through the DDS, would require something like that SSB transmitter. The modems used with Codec2 at VHF/UHF are one frequency at a time, but consume much more bandwidth than we can use at HF.

The Tiva M4 has floating point in hardware. One could do these computations in fixed point, but floating point should make it much easier to port existing bodies of code. Given that this is ultimately supposed to be a trail rig and we have no firm idea of exactly what we might do with digital radio yet, I'd shoot for the cheapest and lowest power M4 we can find, which is the Tiva. When clocked an 1 MHz with all peripherals on, the data sheet shows it draws around 1 ma at 3.3v (as I recall). Around 30 ma at full throttle. Let us know what you think, I suspect you know considerably more than I about these computations on ARM processors.

Looks like Yahoo clipped my previous link to a mail forum in which codec2 on the Tiva was discussed, so I'll include the pertinent text here. Google for it, and there's plenty of other such material from the folks working on codec2. Sounds like porting codec2 to an M4 has already been done.

I think it's worth trying for simplex. The build is similar enough to ST32F4
that it's easy to do. Andy Wood <andyw...@hotmail.com> wrote:
>The TI chip is an 80-MHz processor core - the STM32F4 only just works
>at 168MHz - around 80% CPU time - running duplex so I don't really
>think it would be worth trying...
>
>It would probably do Speex OK as the STM32 takes about 25% in duplex.
>
>Andy.
##########
Regarding my previous comment on dropping work on pskuc.c, the real reason is that algorithm development was fun, wading through somebody else's MSP430 assembler for several days was not. And there was pretty much zero interest expressed. And there were plenty of other things pressing to be done.

The pocketdigi source code is freely available. Anybody fluent in C language shall be able to port it to any platform. I don't have resources to do it myself.

The only thing special to pocketdigi / ATS or MTR is the way it commands the transceiver to do key on/off and to phase/frequency modulate the DDS. The protocol is relatively straightforward and anybody fluent in the C language shall be able to understand it from the pocketdigi source code.

If anyone wants to implement a simple standalone data terminal, he could use the pocketdigi sources to implement the transmit part. No special interface on receiving, just the audio cable.

I know a guy who is having a rig designed which uses the Cortex M3 as the processor. If you ask me, serious over kill for the application. If and when that rig becomes available, maybe you guys can hack that rig to make it do crazy digital modes.

At the moment he can't get the keyer to work properly. There seems to be two problems - one, the programmer is trying to do it in "C" and two, the programmer, not being a Ham, doesn't understand how it's suppost to work.

The reason I know this is because he asked for my help with the keyer issue. Which I would have been glad to do, if I knew anything about programming in C, which I don't. The best I could do was make some timing diagrams and flow charts for him, but apparently the programmer still can't quite grasp the concept. Any C++ experts here in the group who might want to help him out?

Clocked at 1 MHz, it would take weeks do processing of digital signals. If your looking to do DSP filtering and decoding and run a display, my guess is you'd have to clock it at a couple 100 MHz.

I think "doesn't understand how it's supposed to work" is a bigger issue than coding in C.

Having figured out C and seeing that on a decent processor like the MSP430 I can get almost the same executable size and speed as in assembly, I'm not keen on figuring out a new assembly language for each processor I come to. If you look over the various projects for the MSP430 launchpad, you'll see they're all in C. An 8 bit machine like an AVR is different matter, C can work but assembly can be much tighter. I have no interest in C++, if I want abstraction I go to Python.

A Cortex M3 or M4 is not overkill if you want to do FFT's and such for digital radio.
The Tiva might not quite have the horsepower for some modes.
If you're just implementing a keyer and running a display and such, an Intel 4004 could do fine.

Anyways, build what pleases you. There is plenty of demand for more of these radios. But if you should ever find it getting old, there's lots of new directions to take it.

I can't, other than to suggest that he look at some Arduino-based keyer
sketches - aren't those loosely C-based?? Something like the keyer at
blog.radioartisan.com should have the keyer code easily accessible.

But then, I can barely drive an Excel spreadsheet...

Here's an interesting description of keying algorithms that might give him something to start from:
http://www.morsex.com/pubs/iambicmyth.pdf
And an introduction to the notion that not everybody wants the same keyer.

I suspect that for something like a keyer, the guy that creates it will have to use it a lot before it gets to be any good. So he should probably just borrow some C code off the web somewhere as Lee suggested. However, that radioartisan keyer has some serious feature creep that might get in the way:
http://blog.radioartisan.com/arduino-cw-keyer/

Hi Jerry,

Not only the Tiva C (LM4F MCU) has enough horsepower to do so, but an I2PHD was working on some kind of "standalone SDR I/Q decoder" with a board from ST Micro (STM32F4) using FP maths.
He got something running but was not sharing the code.

Here some other project that could be ported to the LM4F by TI :
http://www.stm32-sdr.com/

I am doing audio FFT (integer maths) and spectrum display on the 20 MHz ATMega328 (source code fully available under GPL), so a 80MHz Cortex M3 or M4 can do it.
Here a "DSP work" for the Cortex M3 :
https://coactionos.com/projects/coactionos/wiki/FFT_on_the_ARM_Cortex_M3

The Cortex M4 on the Tiva board (and Stellaris) embed the Neon instructions (Vector Maths on floatting) and that gives even more power for DSP-like things. However there is a lot of coding to do in order to use it...

Hello all

I don't know if I am alone on this, but I would like like to get back to the days when I understood what the posts to this site were talking about - we seem to be moving a long way from the 'simple' trail-friendly radios that Steve excels at.

If digital modes are what are pushing people's buttons at the moment, I for one would be delighted to see something like a modern version of Small Wonder's PSKxx radio to be be used with the AMQRP Club modem.

Just my 5 centimes worth...

From: XV4Y
Topic: 12268 Message: 12268

Hi folks,

I know I know I know, the manual states that using the MBDC on theses bands is not recommend.
However I was planning to just build the RX part of the kit, but recently I decided that it was perhaps a "good idea" to experiment on the higher bands.
Has anyone tried to build the MTR for other bands than 160 and 80m?
What ever the answer is, I will try it on 40m and 15m (10?), but I'd like to share experience.

I've been playing with the chinese AD9850/AD9851 modules for some time and the quality is variable.
From the experience of G0UPL kits (using similar TX and PA topology), some OM have successfully built them even on 10m.
At that frequency, the "duty cycle" pot becomes very touchy, but that works and the "fried Bs170"/W ratio is reasonable.

Topic: 12199 Message: 12269

Steve and everyone,

I just scanned through the recent posts and want to comment on the Santa's Wish LIst topic about possible new rigs:

In the past several months I've done many SOTA activations using my ATS3-B on 15M, as well 20M, 17M, 30M and 40M. With good solar flux, 15M is a great QRP portable band and the ATS3-B delivers solid performance! If a kit ATS-style radio were offered for several higher bands, I would jump to get one, even though these bands will not stay open indefinitely.

15M needs smaller, lighter antennas than 20M. The band is quiet, and DX is easy to hear. Being on a high summit with a 5W rig running on 15M when the band is open is a big thrill! I've had many QRP-QRP contacts on 15M, with strong signals and easy ragchew quality.

Here's my wish list for the ATS-type rigs:

1) Preserve the many virtues of the current rigs
2) At least 3 bands available, and be able to pick which 3, etc.
3) Protection or tolerance for poor SWR - not easy to do
4) One LED display
5) Some kind of low-profile tuning knob
6) Better AGC than the MTR has

7) One of the problems I now have on SOTA activations is that when I get a pile, I can't copy any caller because they saturate the audio in the ATS3-B, and the audio is all levelled. Sometimes I can't copy a letter until someone running an amp or whatever drops out. Only simple cure for this would be a receive RF gain control or button. This is a special problem, really a good problem to have - except it wastes time when conditions are difficult on the summit.

8) DSP might offer improved AGC, reduced noise, better audio, etc., but it's not worth it if power drain goes up much, or if it makes the rig too complex to develop. That's what the KX3 and K3 are there for, etc.

I have used a KX3 in the field, and it's awesome, but for actual hiking-climbing SOTA and backcountry camping I want my ATS rigs because they're light, they use less power, and they do a very good job on CW. Elecraft badly compromised the KX3 for serious portable work by making the case large enough for internal batteries, and poor batteries as well, instead of making it smaller and lighter and then offering various external battery options.

Digital modes are opening up a huge new frontier for portable work, and this is going somewhere for sure. I think we're better off with dedicated rigs for digital modes, rather than trying to make one rig do many different modes with various features.

Right now SOTA is expanding and getting more popular. There is actually a big potential market out there - but many of these customers already have KX3's, and that's fine. I think there is unserved demand out there. If Steve offered a rig that was somewhere between the

KX3 and the ATS3-B, ATS4, MTR, etc., he might sell many. Of course you don't want to over-supply the market, but right now I think people are buying other stuff like the Chinese QRP radios because they can't an ATS rig when they want to order one. Lots of QRP people haven't got time to be active in this group, etc,

The time to offer more kits is sooner rather than later, given the high sunspots and all the expansion of SOTA. There may be activity programs similar to SOTA - with broader appeal - that take off as well, before long.

Just my thoughts - I don't have a crystal ball.

I remain sincerely grateful for the experiences that I've had because of Steve's kits and what they have led to. Every time I set up on a Colorado mountain and start calling CQ on my ATS3-B or my MTR, I remember how Steve's hard work and creativity have opened up this corner of the hobby for so many of us!

The main problem with so called "Digital" modes is that they are designed to operate with analog, SSB rigs!

When you have to control frequency, phase and amplitude for some of these modes, it gets a bit complicated. Easier just to make a SSB rig so the interface is just audio.

To make a truely stand alone digital mode rig would take some serious R+D effort. Maybe I should just hole up for the winter and try to learn C. In a couple of years, I might be proficent enough to make something useful. I should live that long, hi

Steve KD1JV

I am a bit selfish on the digital to smart phone idea to grab scout interest.

If C is hanging you up, I'd be happy to help you with a gentle introduction. Once you figure out C, you can pretty much forget about having to learn new assembly languages. And figuring out C is easier than learning a new assembly language.

Vojtech's Pocketdigi is still viable if anyone has the inclination to port it to a currently available device. It does well enough within the receive bandwidth and single tone transmit limitations of the ATS/MTR rigs. But I'd still like to see a standalone rig drawing minimal power that can do digital modes. An MTR with a Tiva instead of an MSP430 plus a DOGM display should be about all that's needed to do that. For low power consumption, the DDS driving a non linear final has some real advantages over an SSB rig.

I've heard the DOGM occasionally had trouble on the ATS4. Exactly how was it failing? Could that be addressed somehow?

C is closer to assembly language than most other high level languages.
Shucks. Compared to some assembly languages, "K&R" C is a lower-level
language.

The PFR-3 conveniently offers the features of the AT_Sprint series in a package the size of the KX3. I'd bet that srmaietta was hoping for the other way around.

That being said, the PFR-3 offers a *very* nice feature set for a QRP CW trail radio, and it isn't much bigger than an MTR plus a tuner. I wonder what it would look like if if were updated to deliver similar features but take advantage of technology improvements and learnings in the years since it was designed?

I am a big proponent of ats series however I recently built the stm32-Sdr rig which decodes and sends Psk via lcd tft touch screen. It uses any of the softrock type transceivers along with the STM/LCD module. No PC needed. Now if something similar with all on one PC board was available that would be the ticket if digital modes are your passion.
Tim

--- In AT_Sprint@yahoogroups.com, <jgaffke@...> wrote:
>
> I'd prefer something standalone and extremely low power, using a display and processor embedded in the rig. Not using a handheld PC. JT9 is 9 tone MFSK, one frequency at a time, so should work fine. Extremely slow, but could be handy as a last resort for getting a brief message through. Digital voice with Codec2 on HF uses the FDMDV modem which has 14 simultaneous QPSK carriers plus one BPSK carrier. So can't transmit it through the DDS, would require something like that SSB transmitter. The modems used with Codec2 at VHF/UHF are one frequency at a time, but consume much more bandwidth than we can use at HF.

srmaietta (me) wasn't hoping for KX3 in an ATSprint package. The desire to miniaturize can be taken too far in my opinion. I know what the PFR is -a unique member of the ATS/MTR family with the same architecture, IC's, PA, UI scheme, etc. in a big-bird enclosure with a few features to make it more of a stand alone trail radio solution. I enjoy the simplicity of Weber's ATS family, no KX3 for me thanks!!

Although I am enjoying the discussion about a digi-modes trail radio, a very interesting concept indeed!! I can imagine using my phone as a simplified waterfall display, a voice to text converter (no keyboard needed) and then the small Weber rig is the TRXcvr.

12280. MTR 40M output low

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2013-12-17 17:36:14 UTC
From: cloud runner
Topic: 12280 Message: 12280

Built my MTR (first version) for 20 and 30 meters, and have used it with great results for a some time. Output on each band exceeded 5 watts. I found from experience that I all stations worked on 30 could have also been worked on 20M. In other wrods, the skip zone on 20 and 30 has been very similar.

so I decided to change the second band to 40 meters. I am not getting the expected output. I am getting about 1.5 watts out with 11.5 volts, just about one watt at 9.5 volts.

I have carefully double checked the number of turns on the toroids, T50-2, 16 and 19 turns. Continuity shows zero point zero ohms across the coils after installation. I have carefully checked the capacitors. They are as in the manual, C47 and C57 are 331's, C52 and C66 are 681 and 68p. I pulled and measured C66, and it is indeed 68p.

Compressing or spreading turns on the toroid has almost no effect.

Have I missed a modification?

Suggestions???

I suggest you look at messages 10988, 11071, 11077, and 11294. Not sure any of that pertains to your particular problem (assuming the rig is telling you it really is running on 40M), but you should be aware of it all before hacking into stuff. In particular, message 10988 recommends a change to the 40M sense resistor, otherwise the rig might think it is running on 80M. And 11071 shows confusion between the schematics and the build instructions on reference designators for the RX filter inductors. And obviously enough, make sure you count those coil turns correctly, a trip through the middle counts as a turn. If you have access to a capacitance meter, you might try lifting a coil wire or two and then measure the TX filter caps (without removing them from the board).

Good luck!

HI Fred, Is it possible, and I ask, because I found out on my own..... don't ask.. way too long to go into here... but is it possible.. that the parts on the bottom of the boarddon't necessarily match the switch positions on the top of the board? Maybe a quick check with an ohmeter would prove it. (don't know about you, ,but I have and ohmmeter... and an ohmeter.. the first one reads resistance.. and the second one reads my personal learning resistance..... as in "OOoooooHHH... now I got it!")

Have a great day,

Hmm, Maybe you have different firmware loaded, there was some out there from VK2DDJ as mentioned in message 9267 that was adjusted to work with the original resistor values. Or maybe I remembered incorrectly. But there seemed to be consensus at the time that the notes in message 10988 were correct.

I damaged the variable capacitor in my Altoids Longwire Antenna Tuner.

Does anyone know what model it is, or how I can order a new one?

Thank you for your help.

Doug might still sell a package of 4 on the qrpkits web site. If not, go buy a cheap AM/FM radio from the popular department store for $5 (yes, they still sell these) and pull one out of there.

Right you are. Just ordered them.

Thank you so much.

12291. What to do with the extra DDS and LCD modules

When the 160 mtr was first proposed I ordered a couple DDS and LCD modules in anticipation of Steve's kit release. Now I'm left with extras and was wondering if anyone has plans for what to do with them. A signal generator or VFO seem likely projects but they would require a controller and software to implement.
I know they were cheap but I hate to let an good chip go to waste. Any circuits or ideas?

Signal generators and VFOs, yes. I'm working up one of the modules now as a Drake FS4 replacement to turn my R4 into a general coverage receiver.

I'm using one of the Arduino Mini Pros available on eBay from China for around 5 bucks. If you go with the Mini Pro, it's not programmable without either another Arduino or a USB converter of some sort. So, you could get a Chinese Arduino Uno clone off eBay for around 10 or 12 bucks I think. There is software out there you can Google up for controlling the DDS modules from Arduino....I found it pretty easy to adapt for my needs.

If you didn't return the original processor I supplied with the kit, you could use that :)

I also have firmware on my web site (http://kd1jv.qrpradio.com) which can be load into an Atmel XMEGA demo board which costs about $30 to make a "universal" VFO or signal generator. The board has it's own LCD display installed on it, so you won't need the 2 liner. The board is also programmed via a USB port.

Ga Steve:
I cant seem to get a hit on that number at Digi key
Has it changed?
Thanks 72
